Current State of System Management on IBM i

© Copyright IBM Corporation 2024

What tools are you using to monitor your IBM i systems?

Choose up to 3:

1. Dynatrace
2. Nagios
3. Instana
4. DataDog
5. Control4i
6. Syslog Reporting Manager (SRM)
7. Created your own
8. Other

© Copyright IBM Corporation 2024

Specialty is a collective disadvantage

1. Dynatrace
2. Nagios
3. Instana
4. DataDog
5. Control4i
6. Syslog Reporting Manager (SRM)
7. Created your own
8. Other

Each solutions may have their own…

- Configuration
- Host installation requirements
- Monitoring capabilities
  - Collect system metrics (active jobs, ASP consumption)
  - View sub system information
  - Identify long-running SQL
  - View job queue

Can you integrate with other tools?

© Copyright IBM Corporation 2024

Do you use Grafana?

Choose 1:

1. Yes, with IBM i
2. Yes, but not with IBM i
3. No, but we want to
4. No, we don’t want to
5. No, don’t know what it is

© Copyright IBM Corporation 2024

Operational Monitoring with Prometheus

© Copyright IBM Corporation 2024

Prometheus Overview

What is it?

- Leading open-source systems monitoring and alerting toolkit
- Collects and stores metrics as timeseries data

Features

- Multi-dimensional data model with time series data
- Provides a functional query language called PromQL
- No reliance on distributed storage
- Has an alert manager built-in
- Easily paired with Grafana and other monitoring solutions

Prometheus

© Copyright IBM Corporation 2024

Prometheus Architecture

© Copyright IBM Corporation 2024

What do exporters do?

Collection of exporters: https://prometheus.io/docs/instrumenting/exporters/

1. Fetch metrics
2. Convert them to Prometheus format
3. Expose data via an HTTP endpoint for it to be scraped

© Copyright IBM Corporation 2024

Data Model for TSDB

- All data is stored as a time series: `(timestamp, value)`

- Each time series has a name (metric name)
  - General feature of a system that is measured

- Each time series can have key/value pairs (metric labels)
  - Identifies a particular dimension of the metric

- Notation: `<metric name>{<label name>=<label value>, ...}`
  - `api_http_requests_total{method="POST", endpoint="/messages"}`

- Time series is uniquely identified by metric name + metric label
  - `temperature{city="Toronto"}`
  - `temperature{city="Rochester"}`

How to use Prometheus with IBM i

© Copyright IBM Corporation 2024

IBM i Prometheus Exporter

- JDBC-based exporter that leverages SQL to export IBM i metrics
- Exports hundreds of metrics including:
  - System activity levels (such as CPU usage)
  - Memory pool information
  - Apache HTTP server metrics
  - Number of remote TCP connections
- User customizable metrics with SQL

https://github.com/ThePrez/prometheus-exporter-jdbc

config.json

home > SANJULA > jar > prometheus > config.json > ...

```
{
  "port": 9853,

  "queries": [{
      "name": "System Statistics",
      "interval": 60,
      "enabled": true,
      "prefix": "STATS",
      "sql": "SELECT * FROM TABLE(QSYS2.SYSTEM_STATUS(RESET_STATISTICS=>'YES',DETAILED_INFO=>'ALL')) X"
    },
    {
      "name": "System Activity",
      "interval": 20,
      "prefix": "SYSACT",
      "enabled": true,
      "sql": "SELECT * FROM TABLE(QSYS2.SYSTEM_ACTIVITY_INFO())"
    },
    {
      "name": "number of remote connections",
      "interval": 30,
      "enabled": true,
      "sql": "select COUNT(REMOTE_ADDRESS) as REMOTE_CONNECTIONS from qsys2.netstat_info where TCP_STATE = 'ESTABLISHED'
      AND REMOTE_ADDRESS != '::1' AND REMOTE_ADDRESS != '127.0.0.1'"
    },
    {
      "name": "Memory Pool Info",
      "interval": 100,
      "enabled": true,
      "multi_row": true,
      "prefix": "MEMPOOL",
      "sql": "SELECT POOL_NAME,CURRENT_SIZE,DEFINED_SIZE,MAXIMUM_ACTIVE_THREADS,CURRENT_THREADS,RESERVED_SIZE FROM TABLE
      (QSYS2.MEMORY_POOL(RESET_STATISTICS=>'YES')) X"
    }
  ]
}
```

Deploying the IBM i Prometheus Exporter

Video Demo: https://www.youtube.com/watch?v=qIcAx4lJZIA

1. Download latest .jar file from release page and store in the IFS:

```
wget https://github.com/ThePrez/prometheus-exporter-jdbc/releases/latest/download/prom-client-ibmi.jar
```

2. If this is your first time, create a default configuration file (config.json):

```
java -jar prom-client-ibmi.jar
```

3. Respond with y for the following message:

```
Configuration file config.json not found. Would you like to initialize one with defaults? [y]
```

4. Confirm the Prometheus client has started:

```
==============================================================
Successfully started Prometheus client on port 9853
==============================================================
```

5. Create a service commander configuration file (prometheus.yml) and start it:

```
java -jar prom-client-ibmi.jar sc
sc start prometheus.yml
```

© Copyright IBM Corporation 2024

Deploying the Prometheus Instance

1. Download the Prometheus-provided image from Docker Hub to some central location:

```
docker pull prom/prometheus
```

or

```
podman pull docker.io/prom/prometheus
```

2. Create a Prometheus configuration file (prometheus.yml):

prometheus.yml U

prometheus.yml

```yml
scrape_configs:
  - job_name: 'prometheus'
    static_configs:
      - targets: ['9.5.12.241:9853']
```

3. Launch the image in a container named "prometheus":

```
docker run -d --name=prometheus -v /path/to/prometheus.yml:/etc/prometheus/prometheus.yml -p 9090:9090
prom/prometheus
```

or

```
podman run -d --name=prometheus -v /path/to/prometheus.yml:/etc/prometheus/prometheus.yml -p 9090:9090
prom/prometheus
```

4. Navigate to Prometheus web UI at http://<container_ip>:9090

Event Monitoring with Manzan

© Copyright IBM Corporation 2024

Manzan Overview

- Open-source event handling tool designed to simplify handling of system events
- Serves as a gateway for publishing IBM i events to a variety of endpoints:
  - User applications
  - External resources
  - Open-source technologies
- Example use cases:
  - Monitor system events with a third-party open source or proprietary tool
  - Consolidate logs for auditing/reporting + query for system events
  - Feed real-time system event data into stream processing systems (such as Apache Kafka)
  - Send alerts for system events

Full Documentation: https://theprez.github.io/Manzan/#/

© Copyright IBM Corporation 2024

Understanding the Architecture

© Copyright IBM Corporation 2024

What are inputs?

Inputs: Sources of your data

- Stream file
- System watch facility (STRWCH)
  - MSGQ
  - LIC logs
  - PAL logs
- Audit journals
- SQL tables
- Arbitrary SQL & CMDs
- System exit points (*coming soon*)

© Copyright IBM Corporation 2024

So practically what can Manzan monitor?

Application crashes	Log data	Specific entries in log data	System Limits alerts
History Log entries	Problem log entries	*SYSOPR messages	Specific job log messages
Audit journal events (future)	PAL entries	VLOGs	Fishy TCP connections (future)

© Copyright IBM Corporation 2024

What are destinations?

Destinations: Locations to send data

- Built-in supported destinations:
  - HTTP/HTTPS endpoints (REST, etc.)
  - Email (SMTP/SMTPS)
  - SMS (via Twilio)
  - Slack
  - FluentD
  - Kafka
  - Sentry
  - Grafana Loki
  - Google Pub/Sub
  - ActiveMQ

- Custom ILE Code

© Copyright IBM Corporation 2024

Can Manzan send data anywhere?

- Many destinations are already working, but there are more to come
- Track supported destinations: https://theprez.github.io/Manzan/#/?id=where-can-i-send-these-events
- Desired target not on the list? Please open an issue to the repository and let us know!

- ActiveMQ ✅
- AWS Simple Email Service (SES) ⏳
- AWS Simple Notification System (SNS) ⏳
- Elasticsearch ✅
- Email (SMTP/SMTPS) ✅
- FluentD ✅
- Google Drive ⏳
- Google Pub/Sub ✅
- Grafana Loki ✅
- HTTP endpoints (REST, etc) ✅
- HTTPS endpoints (REST, etc) ✅
- Internet of Things (mqtt) ⏳
- Kafka ✅
- Mezmo ✅
- Microsoft Teams ⏳
- PagerDuty ✅
- Sentry ✅
- Slack ✅
- SMS (via Twilio) ✅
- Splunk ✅

✅ = implemented 🌓 = partially implemented ⏳ = future

© Copyright IBM Corporation 2024

Understanding the Architecture: Handler and Distributor

Handler

- Start system watches based on config files (data.ini)
- Transform system event data into structured format
- Add structured data to table or send over socket

Distributor

- Fetch data off table or via socket
- Send data to destinations using Apache Camel based on config files (dests.ini)

Data From Message Queue

```
{
    "EVENT_TYPE" : "message",
    "SESSION_ID" : "SANJULA",
    "JOB" : "286747/QSECOFR/QP0ZSPWP",
    "MESSAGE_ID" : "*IMMED",
    "MESSAGE_TYPE" : "*INFO",
    "SEVERITY" : 80,
    "MESSAGE_TIMESTAMP" : "2025-01-29 22:17:23.199",
    "SENDING_USRPRF" : "SANJULA",
    "MESSAGE" : "Hello World!",
    "SENDING_PROGRAM_NAME" : "QCAPCMD",
    "SENDING_MODULE_NAME" : "          ",
    "SENDING_PROCEDURE_NAME" : ""
}
```

Data From Stream File

```
{
    "FILE_NAME" : "my_app_logs.txt",
    "FILE_PATH" : "/home/SANJULA/my_app_logs.txt",
    "FILE_DATA" : "[ERROR] Application crashed due to memory leak"
}
```

© Copyright IBM Corporation 2024

Configuring Inputs and Destinations

Configuration files are stored in /QOpenSys/etc/manzan

app.ini

Used for general Manzan configuration (leave the default contents)

app.ini

config > app.ini

```
[install]
library=MANZAN
```

data.ini

Used for configuring different inputs

data.ini

data.ini

```
[<id>]
# The type of input (file or watch):
type=<type>
# As defined in dests.ini:
destinations=<destinations>
# Optional properties:
format=<format>
enabled=<enabled>
# Other <type> specific properties
# (ie. file, strwch)...
```

dests.ini

Used for configuring different destinations

dests.ini

dests.ini

```
[<id>]
# The type of destination
# (ie. smtp, slack, twilio, sentry)...
type=<type>
# Optional properties:
format=<format>
# Other <type> specific properties
# (ie. server, webhook, from, dsn)...
```

© Copyright IBM Corporation 2024

Example data.ini configurations

Stream File

- Watch a log file (test.txt) and only take action when a line written to the file contains the string “error”

```
[logfile1]
type=file
file=test.txt
destinations=email_it, test_out
filter=error
format=$FILE_DATA$
```

System Watch

- Watch all messages in the IBM i history log and format the message into a human-sensible format

```
[watchout]
type=watch
id=jesse
destinations=test_out, slackme
format=$MESSAGE_ID$ (severity $SEVERITY$): $MESSAGE$
strwch=WCHMSG((*ALL)) WCHMSGQ((*HSTLOG))
```

© Copyright IBM Corporation 2024

More example data.ini configurations

SQL Table

- Watch when data is inserted into a table (company.announcements) and write to slack/kafka

```
[table1]
type=table
table=announcements
schema=company
destinations=slack, kafka
format=$DATA$
```

Audit Journals

- Watch for login failures on the system and write messages to slack

```
[audit1]
type=audit
destinations=slackme
auditType=PASSWORD
fallbackStartTime=1
format=Violation type: $VIOLATION_TYPE_DETAIL$, username: $AUDIT_USER_NAME$
```

© Copyright IBM Corporation 2024

Example dests.ini configurations

Send to Manzan's standard output

```
[test_out]
type=stdout
```

Send an email

```
[email_it]
type=smtps
format=Hey, check out this information!! \n\n$FILE_DATA$
  server = my.smtpserver.com
  subject = Testemail
  from=me@mycompany.com
  to=me@mycompany.com
```

© Copyright IBM Corporation 2024

More example dests.ini configurations

Send message in Slack channel:

```
[slackme]
type=slack
channel=open-source-system-status
webhook=https://hooks.slack.com/services/TA3EF58G4...
```

Send event to Sentry

```
[sentry_out]
type=sentry
dsn=https://k23de06d7bff24f18a86f33178e67291@o1963...
```

Send SMS message with Twilio

```
[twilio_sms]
type=twilio
componentOptions.sid=AC1234567890abcdef1234567890a...
componentOptions.token=8aebaa92e9a4f6d85cf5c0e6ba3...
to=+12345678901
from=+10987654321
```

© Copyright IBM Corporation 2024

Let’s put it together…

dests.ini

```
[slackme]
type=slack
channel=open-source-system-status
webhook=https://hooks.slack.com/services/TA3EF58G4...
```

data.ini

```
[watchout]
type=watch
id=jesse
destinations=slackme
format=$MESSAGE_ID$ (severity $SEVERITY$): $MESSAGE$
strwch=WCHMSG((*ALL)) WCHMSGQ((*HSTLOG))
```

© Copyright IBM Corporation 2024

What does it look like in Slack?

open-source-system-status – Dec 20th, 2022

ibm i system monitor APP 9:01 PM

CPIAD09 (severity 0): User LINUX from client 9.163.40.192 connected to job 492988/QUSER/QZDASOINIT in subsystem QUSRWRK in QSYS on 12/20/22 20:17:06.
