

Modern, Buildable Projects

with IBM i Project Explorer and Bob

Edmund Reinhardt

Product Architect - IBM i Application Development

edmund.reinhardt@ca.ibm.com

Sanjula Ganepola

Software Developer

sanjula.ganepola@ibm.com

Agenda

- Challenges with Building on IBM i
- How do IBM i Projects and Bob overcome this?
- Ins and Outs of IBM i Project Explorer
- Demo

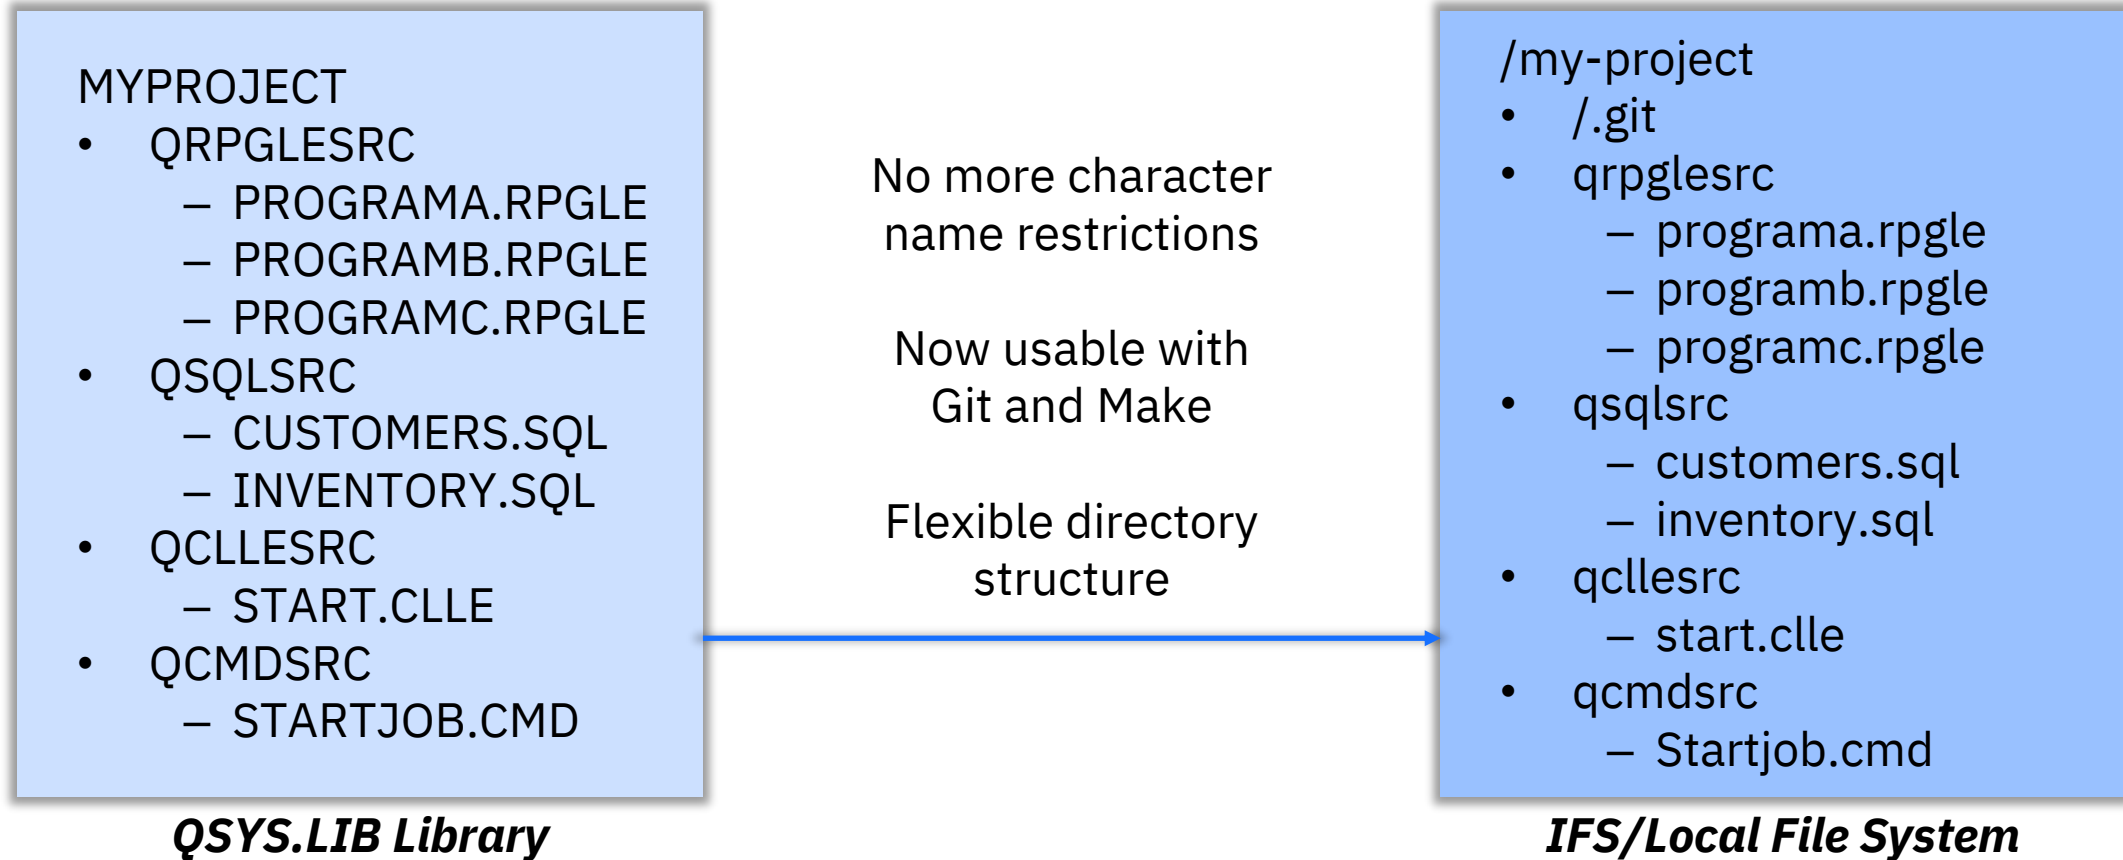

Challenges with Building on IBM i

Building on IBM i is hard...

- 1 SRC-PF
 - 10 char names
 - Fixed record length
 - Not accessible to open ecosystem, including Git and Make
 - Source of the same type stored in QxxxSRC to avoid name conflicts (member type does not disambiguate)
- 2 Libraries
 - Only 2 level hierarchy to organize, with only short 10 char names
- 3 Source control
 - None (sequence number dates)
 - Home grown
 - Proprietary IBM i systems
 - Cost
 - Smaller market = less investment
- 4 Build system
 - Individual CRTXXXMOD + CRTPGM
 - CL Scripts
 - A couple of vendors have dependency-based build

How do IBM i Projects and Bob overcome this?

Let's use a different (but similar) file system

Unlocking source control with Git

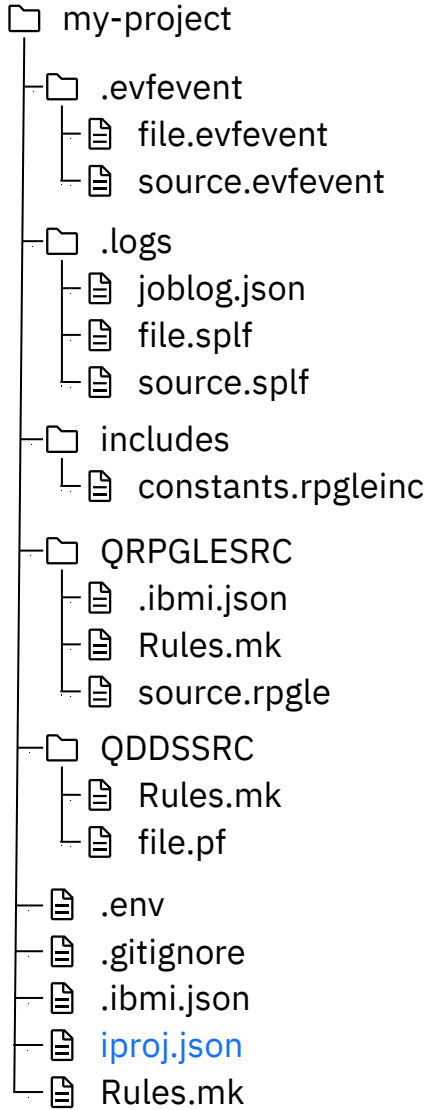

Distributed Development

Version Control and Git Workflow

Projects that self-describe how to build themselves!?

Project Information

Configure library list

Configure build/compile environment

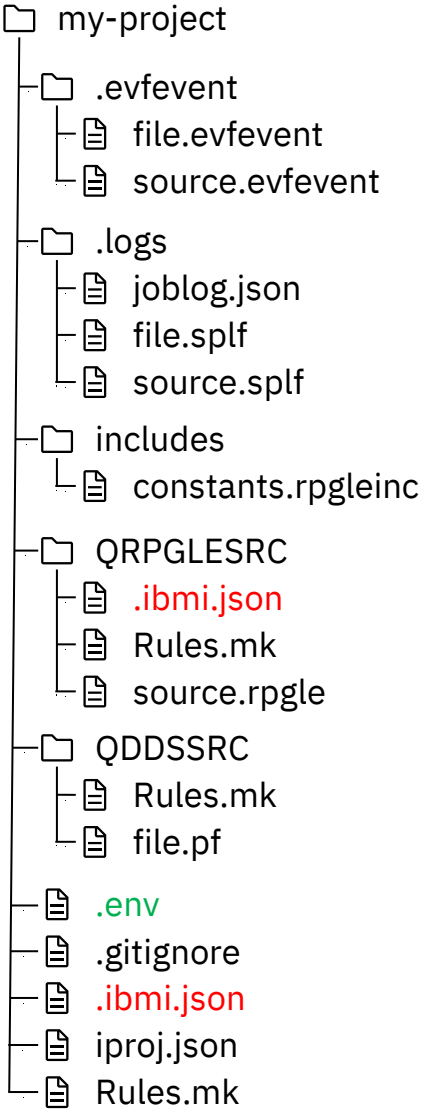

```
{ } iproj.json x
{ } iproj.json > ...
1 {
2   "version": "0.0.1",
3   "description": "SAMPLE PROJECT",
4   "repository": "https://github.com/edmundreinhardt/bob-recursive-example.git",
5   "license": "Apache 2.0",
6   "objlib": "&CURLIB",
7   "curlib": "&CURLIB",
8   "includePath": [
9     "includes",
10    "QPROTOSRC"
11  ],
12  "preUsrlib1": [
13    "&lib1"
14  ],
15  "postUsrlib1": [
16    "&lib2"
17  ],
18  "setIBMiEnvCmd": [],
19  "compileCommand": "makei c -f {filename}",
20  "buildCommand": "makei build"
21 }
```

Standardized metadata format with variables (&...)

Set build/compile command

iproj.json in project root

Flexible subdirectories and build customization

```
{ } .ibmi.json X
{ } .ibmi.json > ...
1 {
2   "version": "0.0.1",
3   "build": {
4     "tgtCcsid": "273",
5     "objlib": "&lib3"
6   }
7 }
```

.ibmi.json in project root or subdirectories

EBCDIC encoding for compiler

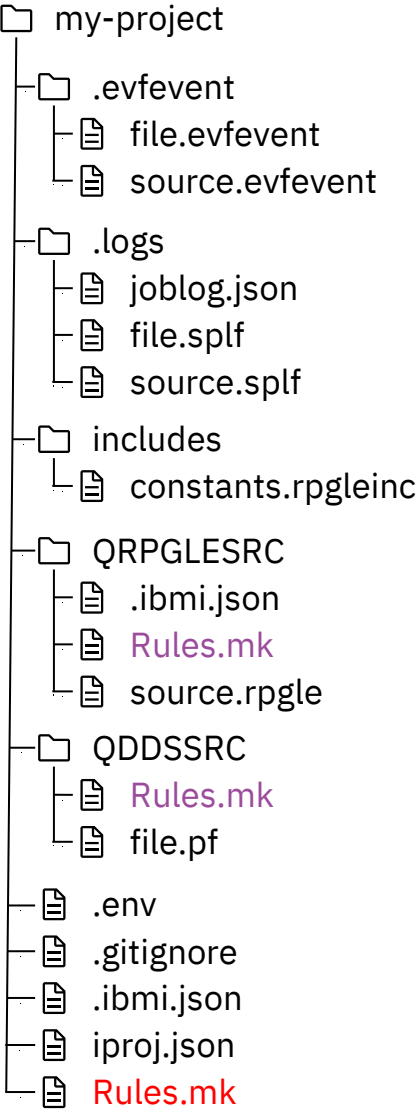

Target object library for directory

```
gear .env X
gear .env
1 LIBL=QGPL QTEMP QDEVELOP QBLDSYS QBLDSYSR
2 CURLIB=SANJULA
3 lib1=MYLIB
4 lib2=ABCLIB
5 lib3=APILIB
```

.env in project root

Custom variable values so that each developer can customize build

Control what objects to build and how to build them

```
M Rules.mk x
M Rules.mk
1 SUBDIRS = qrpglesrc qddssrc
```

Rules.mk in project root

Declare subdirectories to be built

```
M Rules.mk x
M Rules.mk
1 FVAT.SRVPGM: fvat.bnd VAT300.MODULE
2 FVAT.SRVPGM: TEXT = Functions VAT
3 FVAT.SRVPGM: private TEXT = Functions VAT
4
5 VAT300.MODULE: vat300.rpgle QPROTOSRC/vat.rpgleinc VATDEF.FILE
6 VAT300.MODULE: private TEXT := bound into FVAT.SRVPGM
7 VAT300.MODULE: private DBGVIEW := *SOURCE
8
9 VATDEF.FILE: vatdef.pf SAMREF.FILE
```

Rules.mk in subdirectories

Makefile with list of objects to be built and from which source files

Build and Compile Process

Initialization and Migration

Command	Description
makei init	Create iproj.json
makei cvtsrcpf	Convert QSYS members to Unicode IFS stream files

Building

Command	Description
makei build	Build the entire project
makei b -t <object>	Build target object
makei b -d <directory>	Build all objects in the specified directory (based on Rules.mk)

Compiling

Command	Description
makei compile -f <stream file>	Compile target object of specified stream file
makei compile -files file1: file2: ...	Compile target objects of all specified stream files

Ins and Outs of IBM i Project Explorer

Overview

The ultimate tool for local development on IBM i!

Set variables

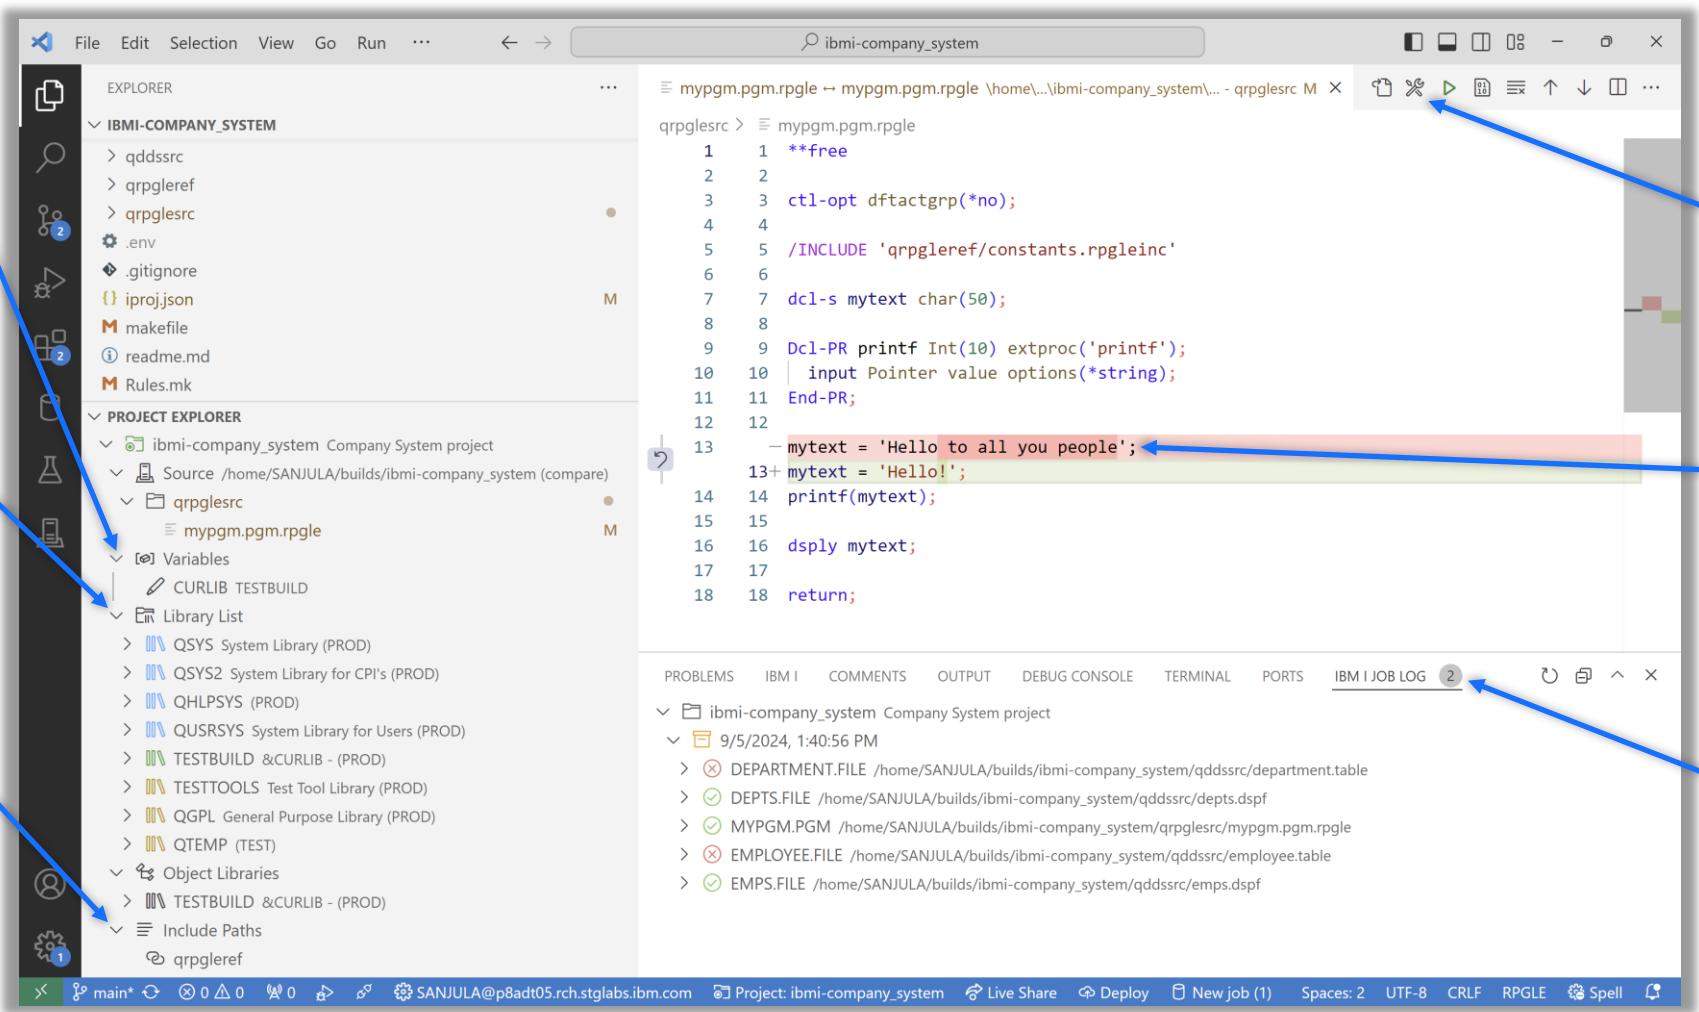

Manage library list

Modify include paths

Build and Compile

Local source vs. IFS source

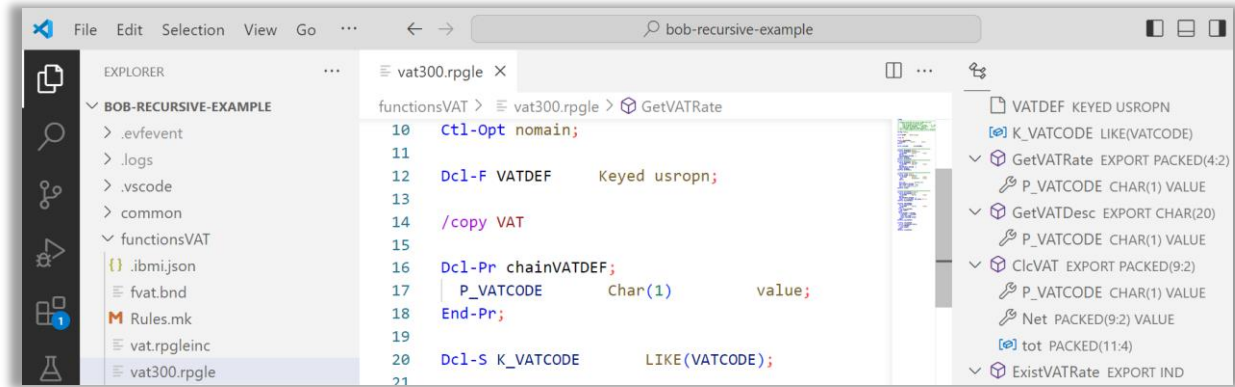

View job logs

Installation

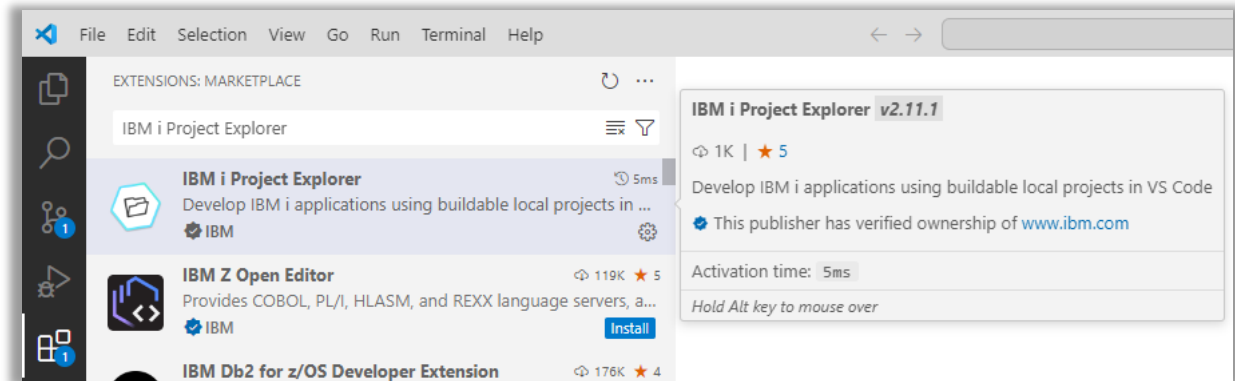

1

*Download
Visual Studio Code*

2

*Download VS Code extensions
IBM i Project Explorer and
Code for IBM i*

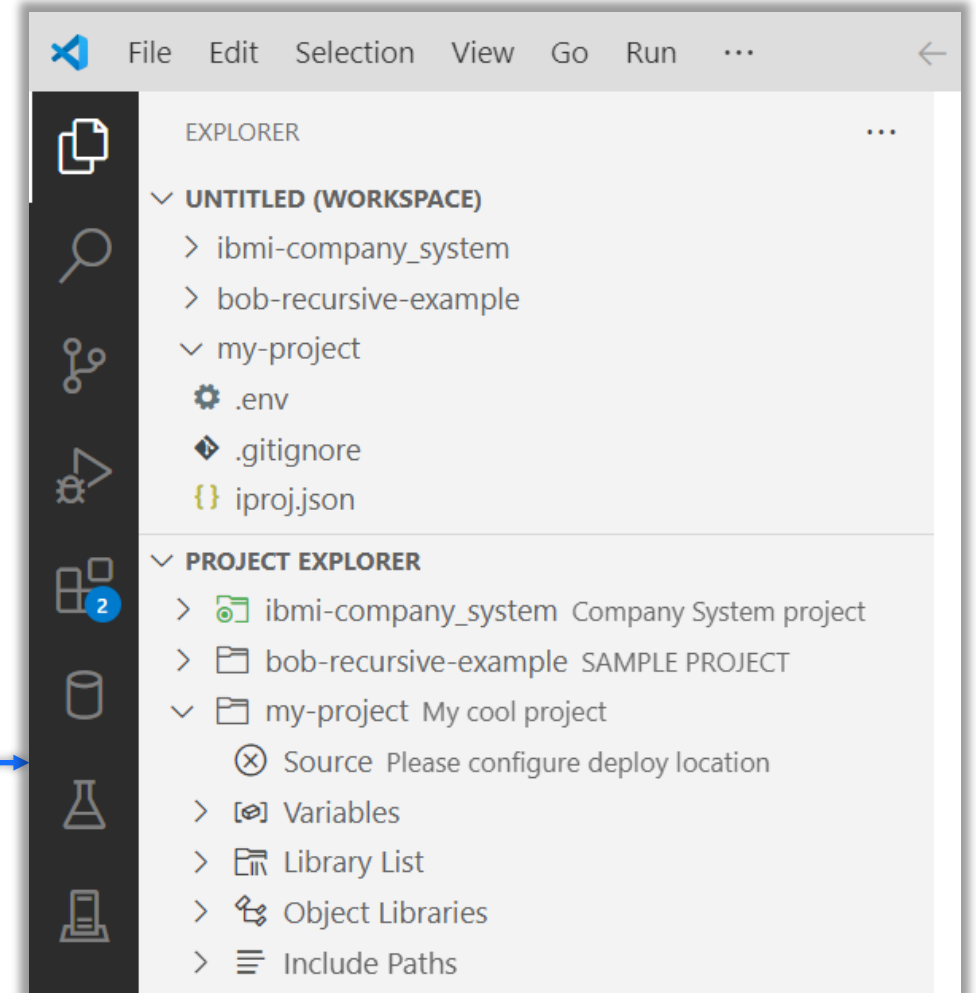

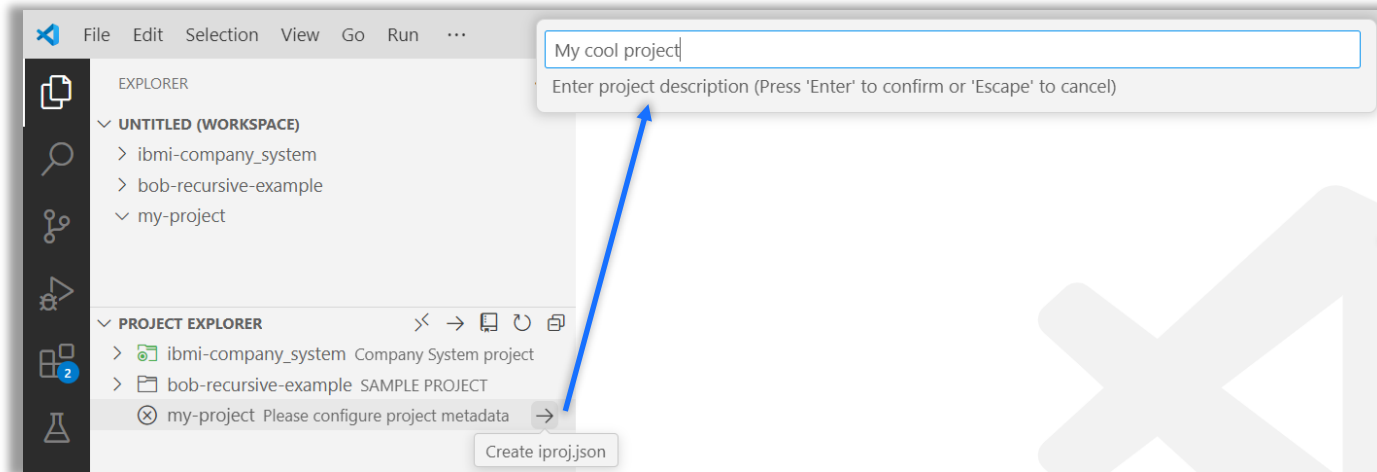

3

*Run
yum install bob
on IBM i*

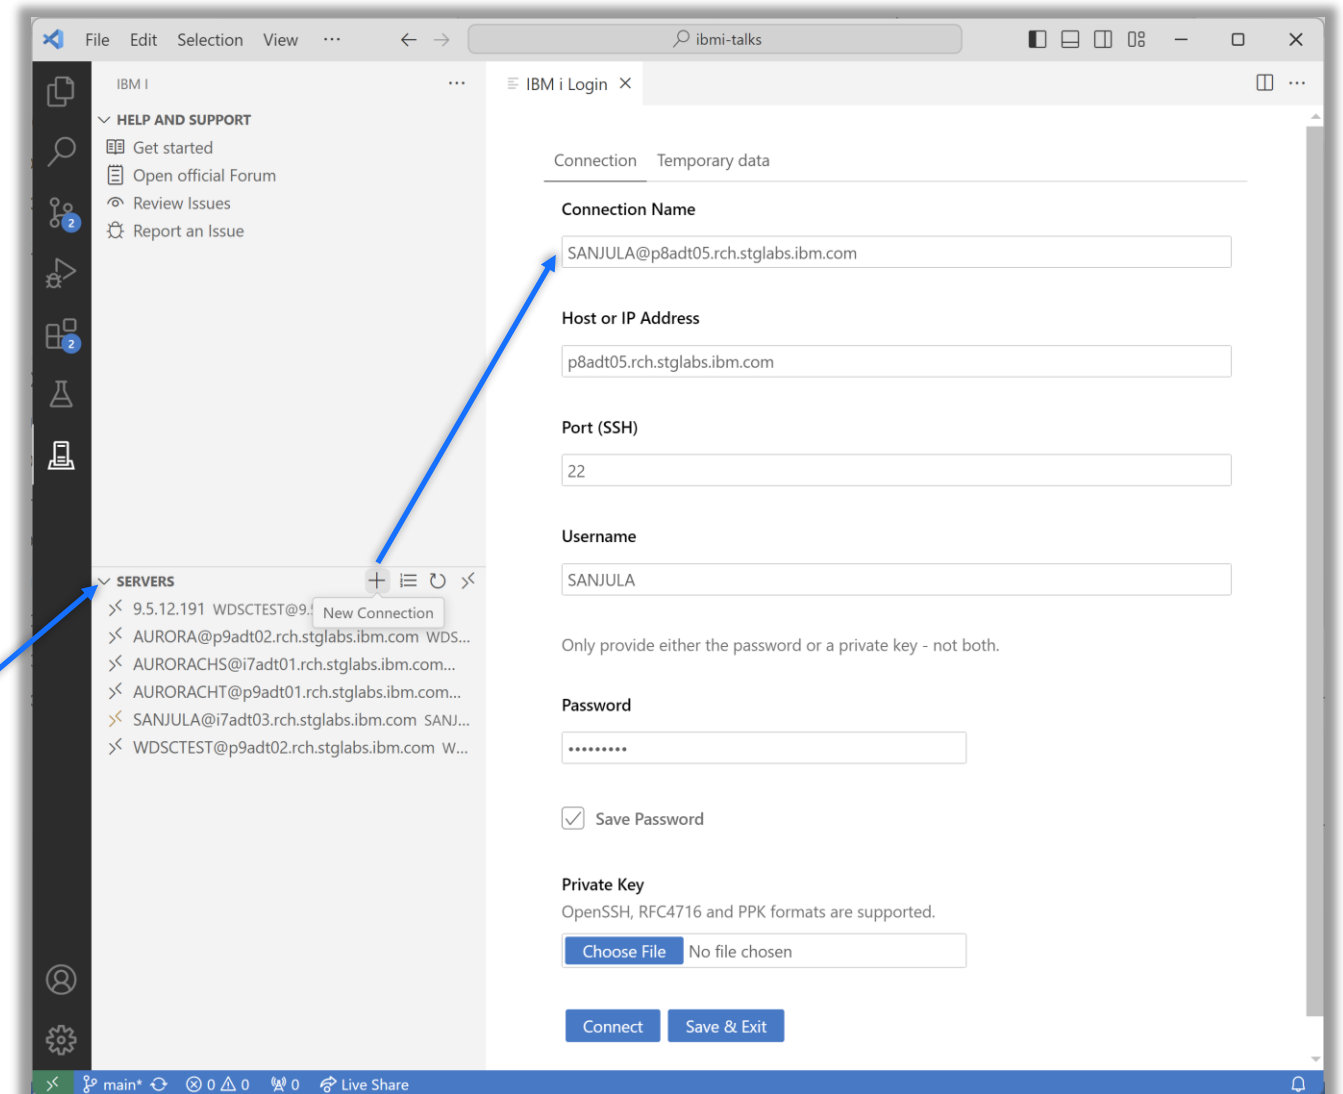

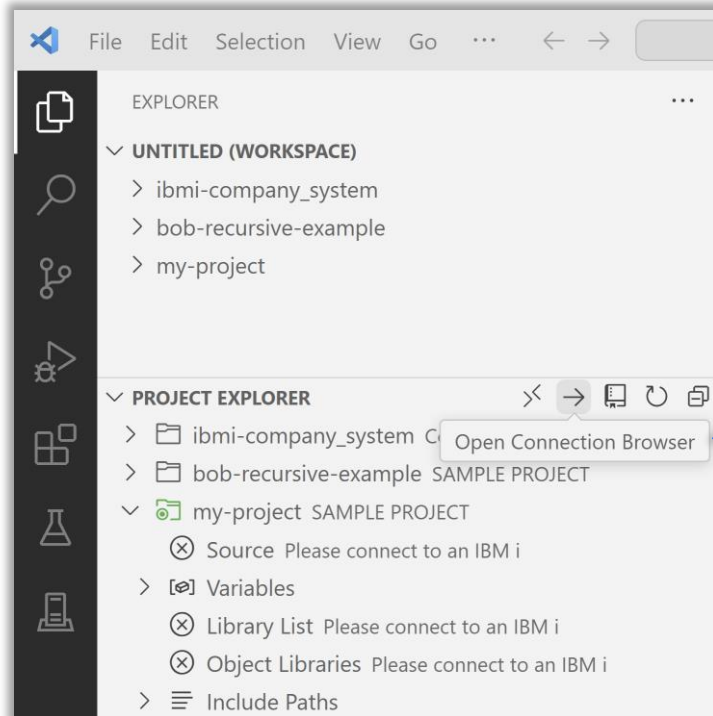

Create a New Project

- Create and open a folder for your project
- Create an `iproj.json`
- Set the project description

Connect to an IBM i

- Open the *Connection Browser* from Project Explorer
- Create new IBM i connection from the *Server* view

Migrate Source from QSYS

CVTSRCPF
from BOB

QSYS members in
source physical files

Properly encoded,
terminated, and named
source files in an IFS
directory

Download to local
project

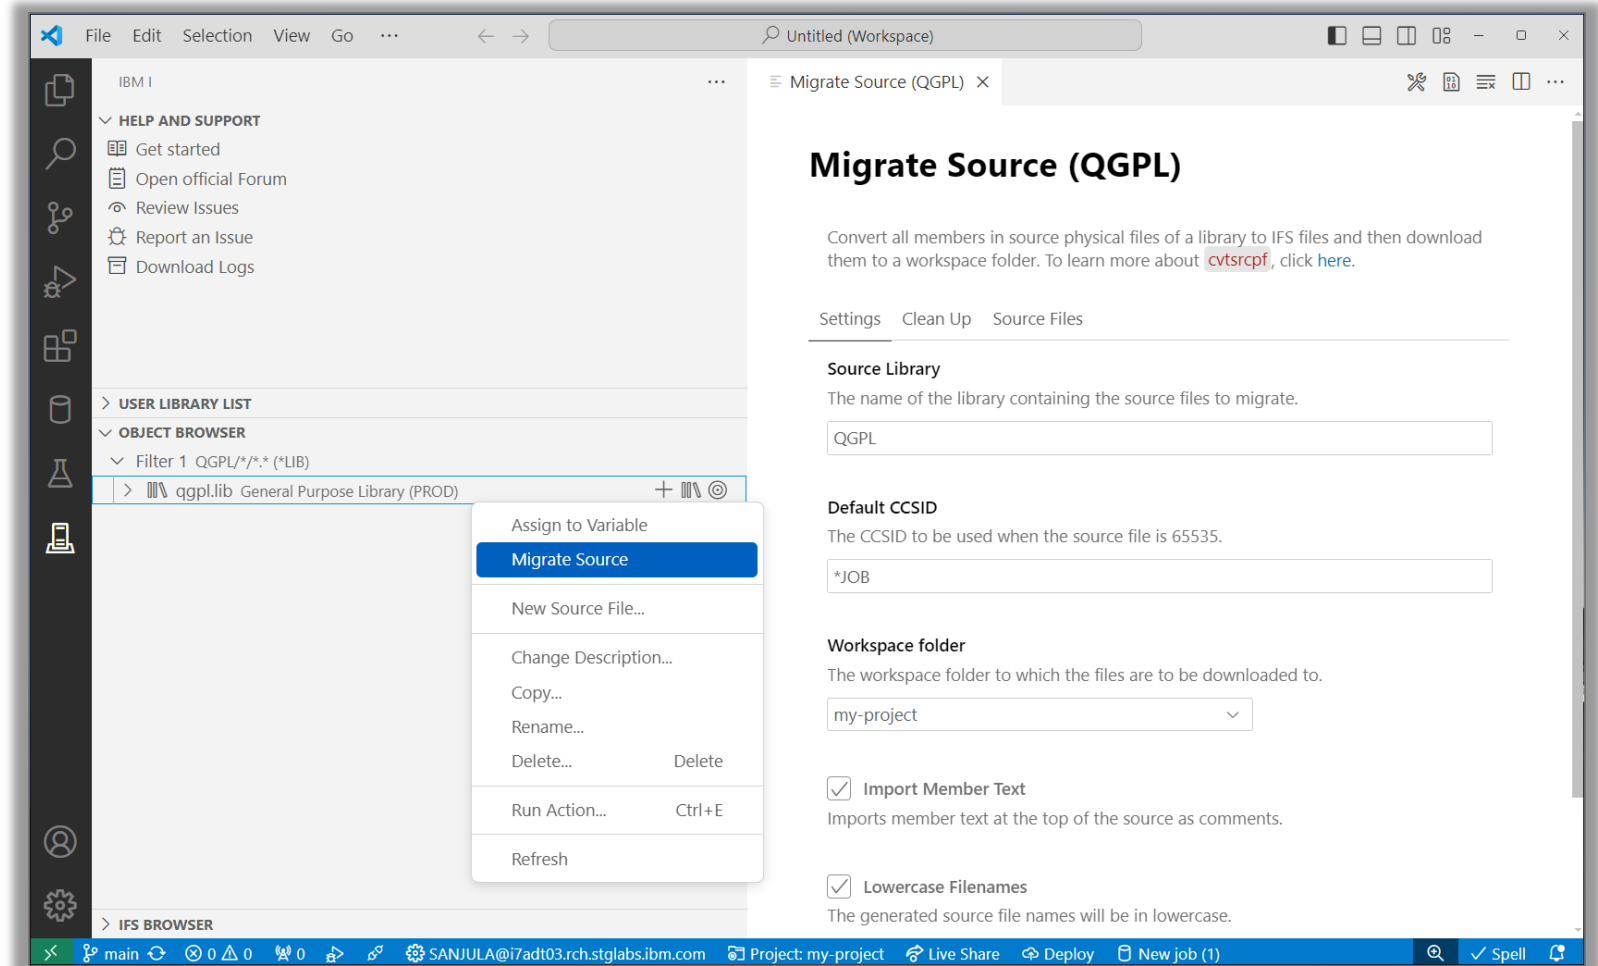

Rename extensions

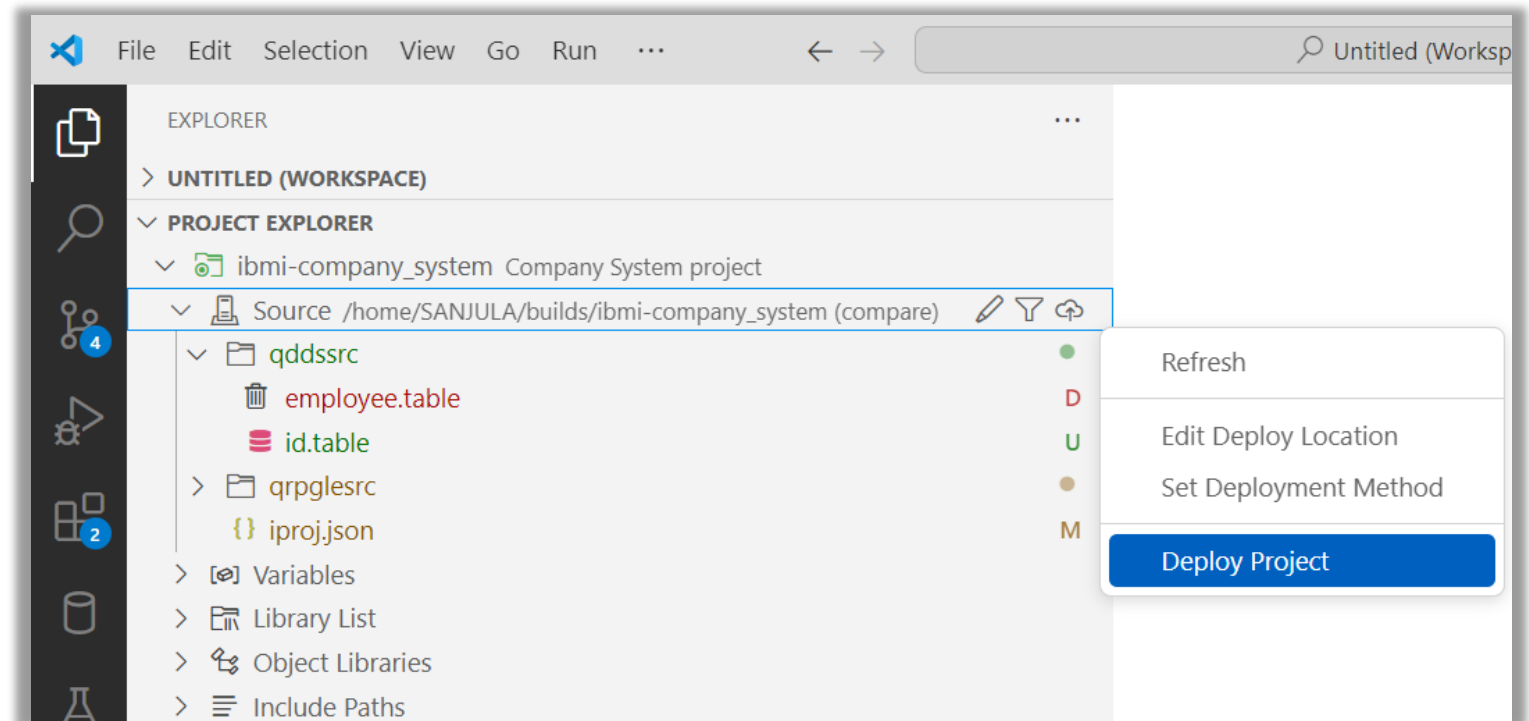

Convert includes/copy
directives to Unix style
paths

Source Orbit

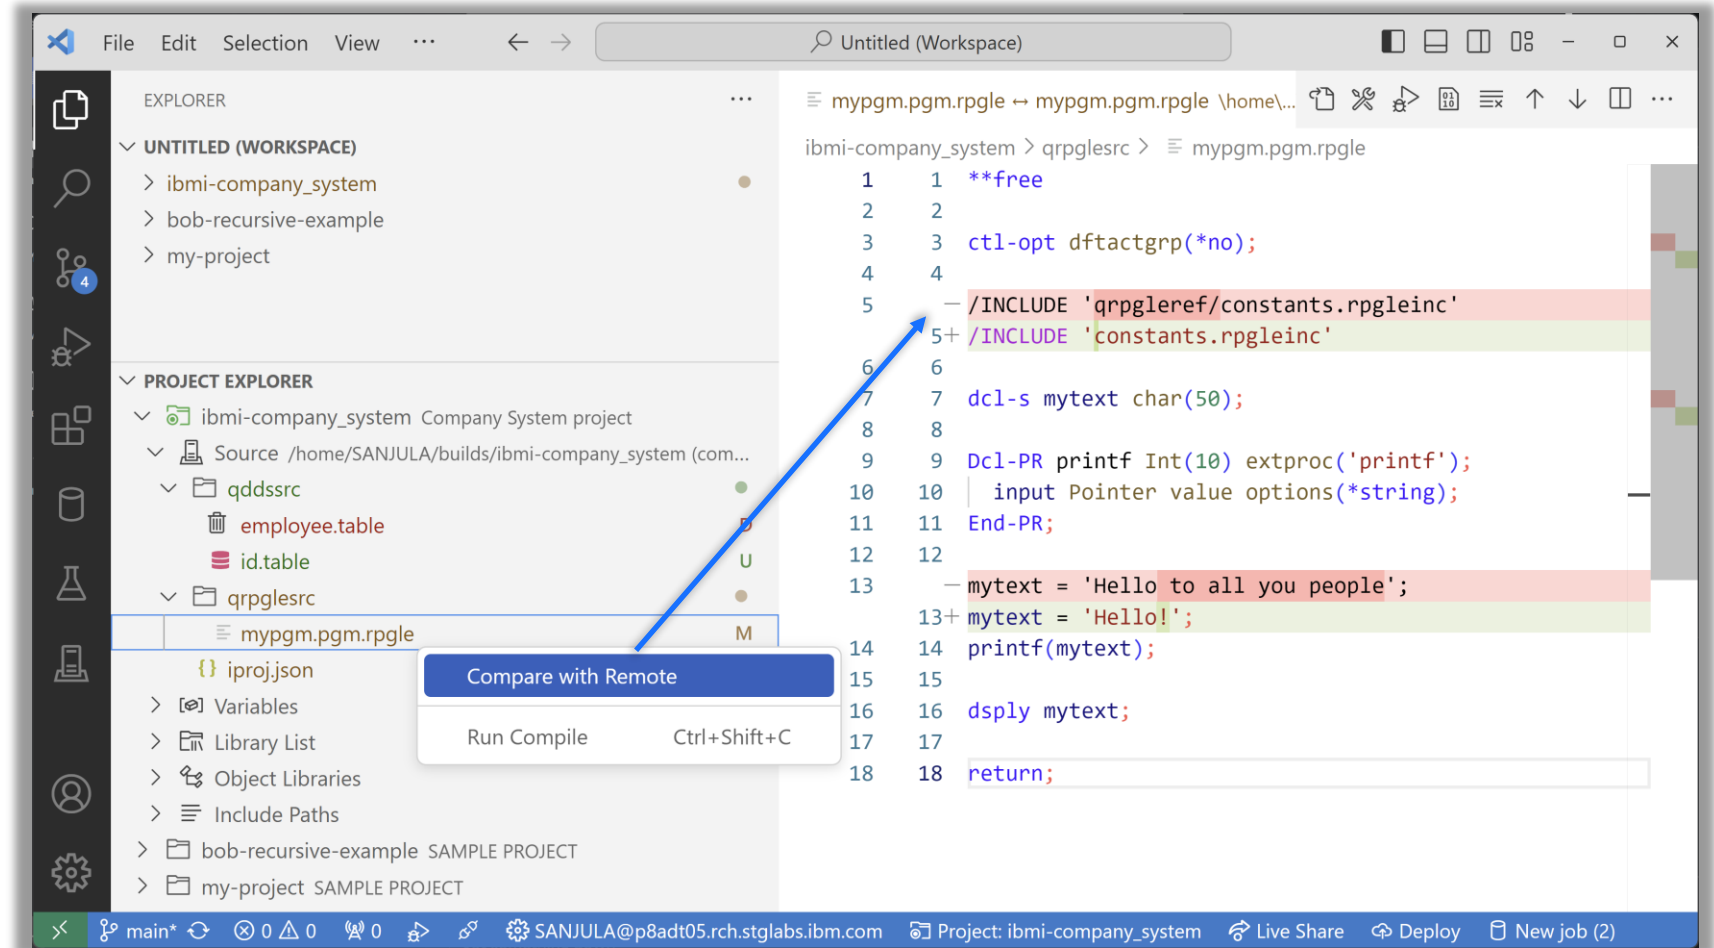

Deployment

- Set deploy location
 - [Where source gets uploaded to](#)
 - Typically set one
 - Each developer gets a unique location
 - Each repository gets a unique location
- Set deployment method
 - [Compare \(typically the safest\)](#)
 - Changes (typically the fastest)
 - Working Changes
 - Staged Changes
 - All
- Deploy project
 - [Moves files to deploy location based on deployment method](#)

Visualize Local vs. Remote Source Files

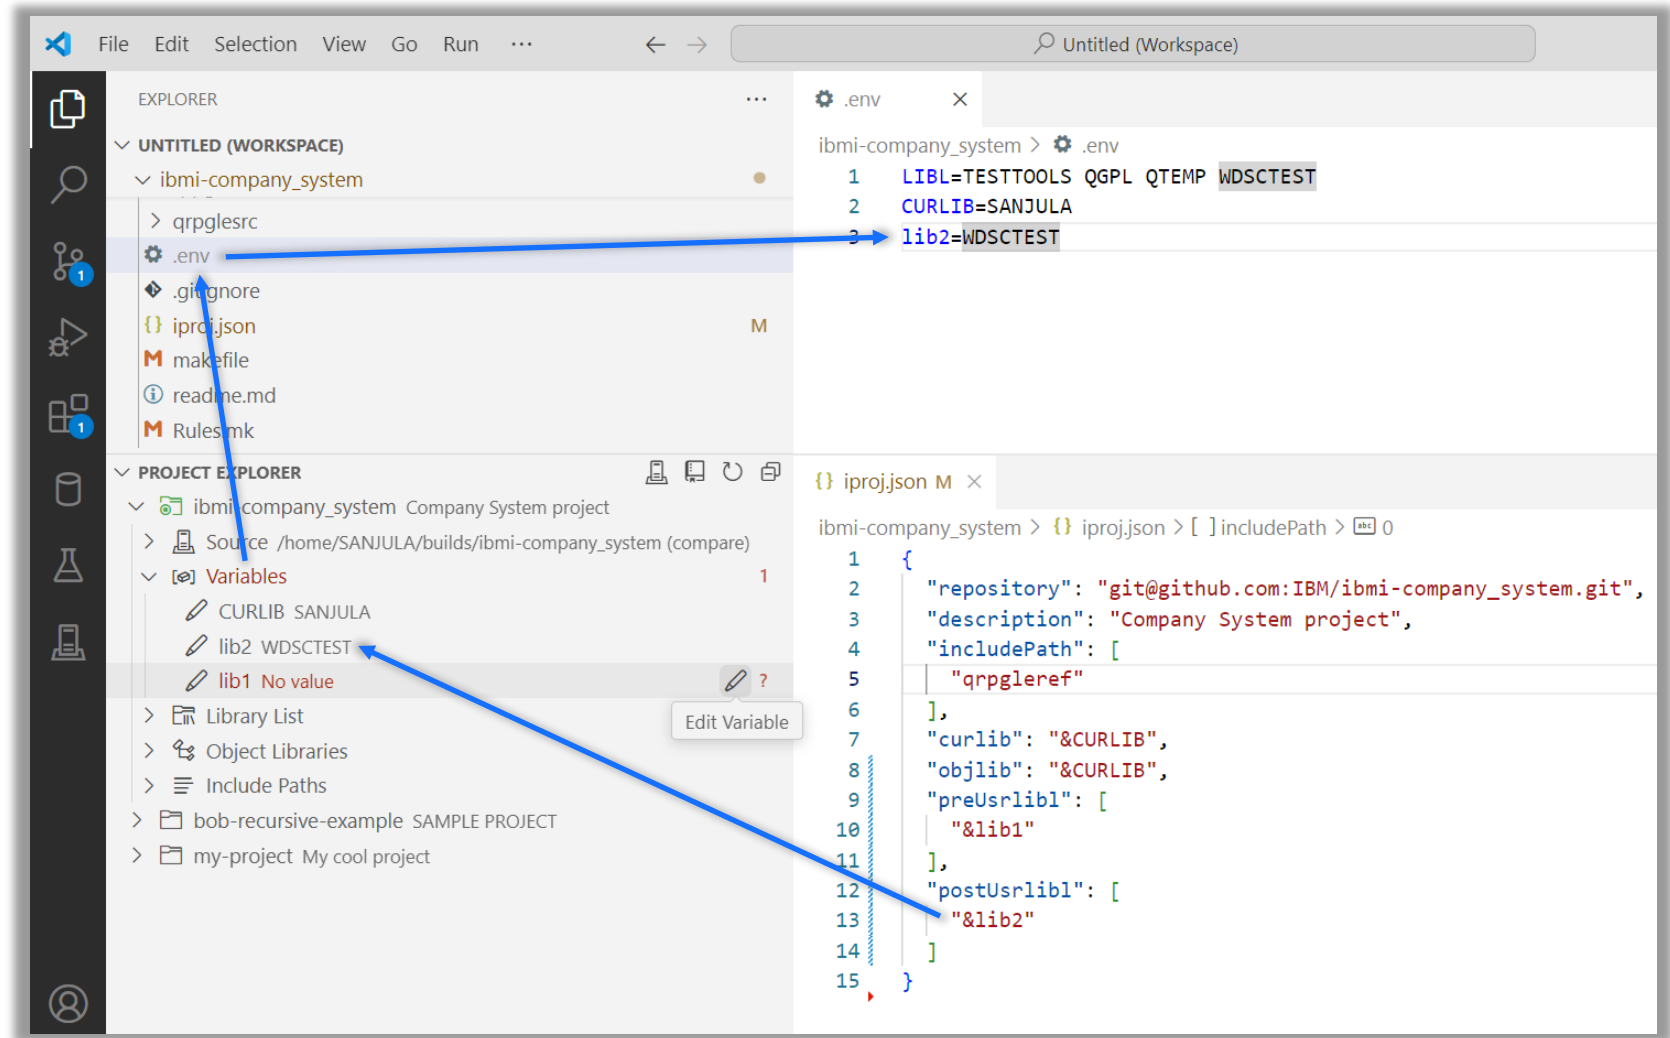

- Visualize, compare, and deploy your local source files to the deploy location in the IFS
- Track file changes (added, modified, deleted, etc.)
- Compare local file content with remote IFS

Work with Variables

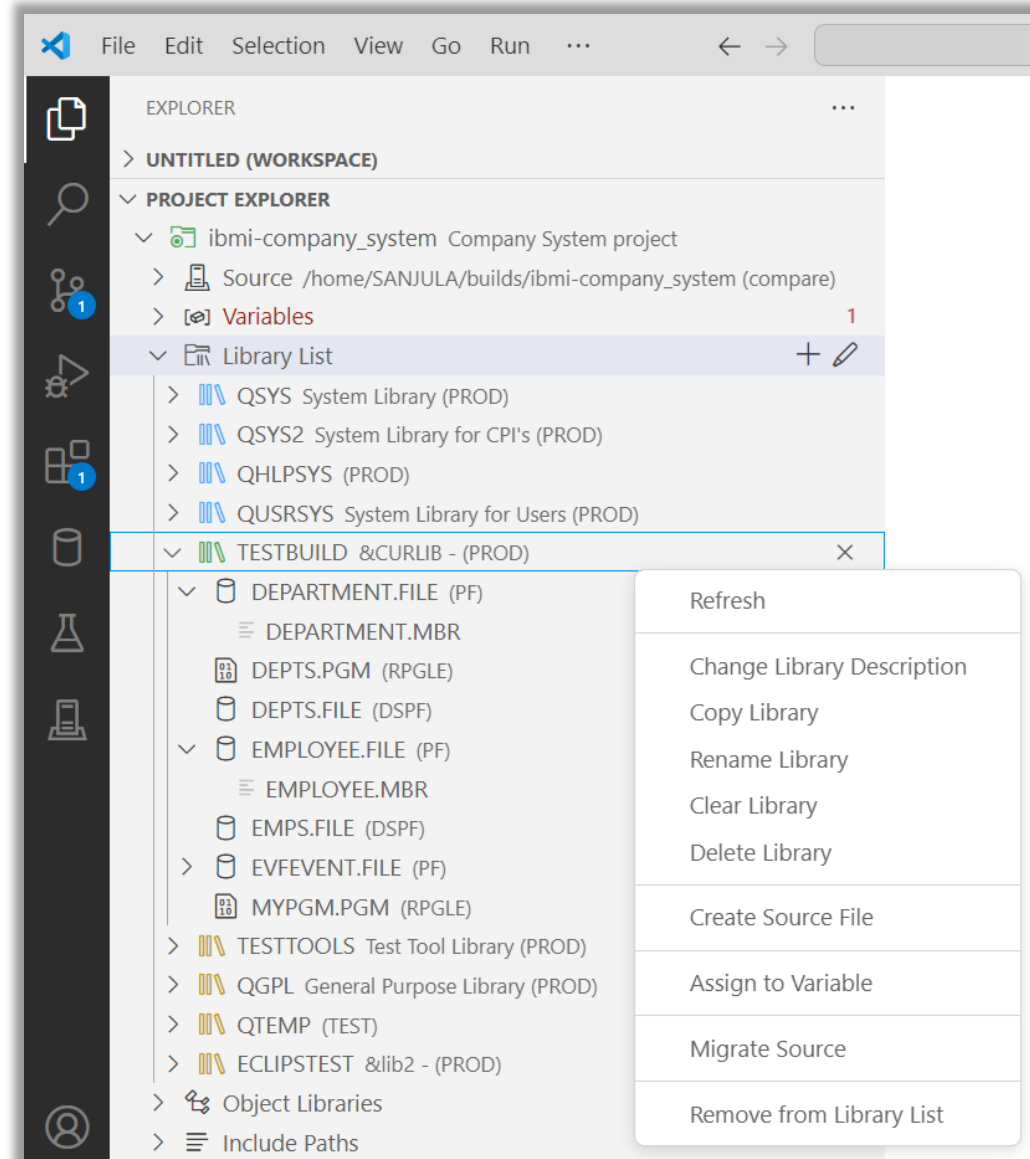

- Reusable project definition that can be used by multiple developers or in automated builds
- View and set variables (for libraries, include paths, or build/compile commands)
- Browse for libraries and assign values to variables
- Configure hardcoded values as variables

Do not push .env file to Git!

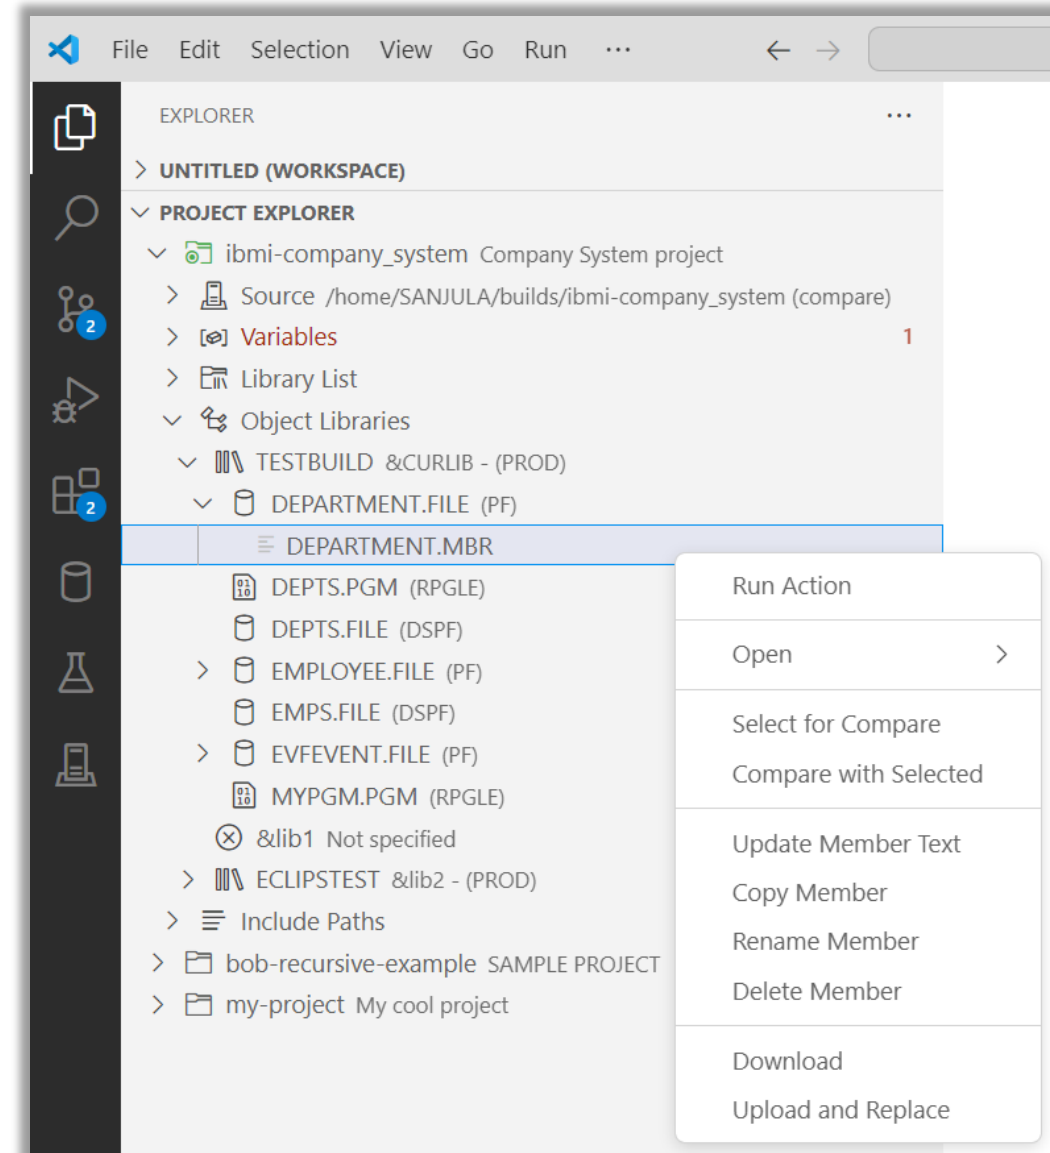

Manage the Library List

- Project's library list is a composition of your user profile's library list (from JOBD) + set of project specific libraries
- Add to beginning/end of library list (preUsrlibl and postUsrlibl) and set current library (curlib in iproj.json)
- Reorder library list
- Browse objects and members
- Manage libraries, objects, and members

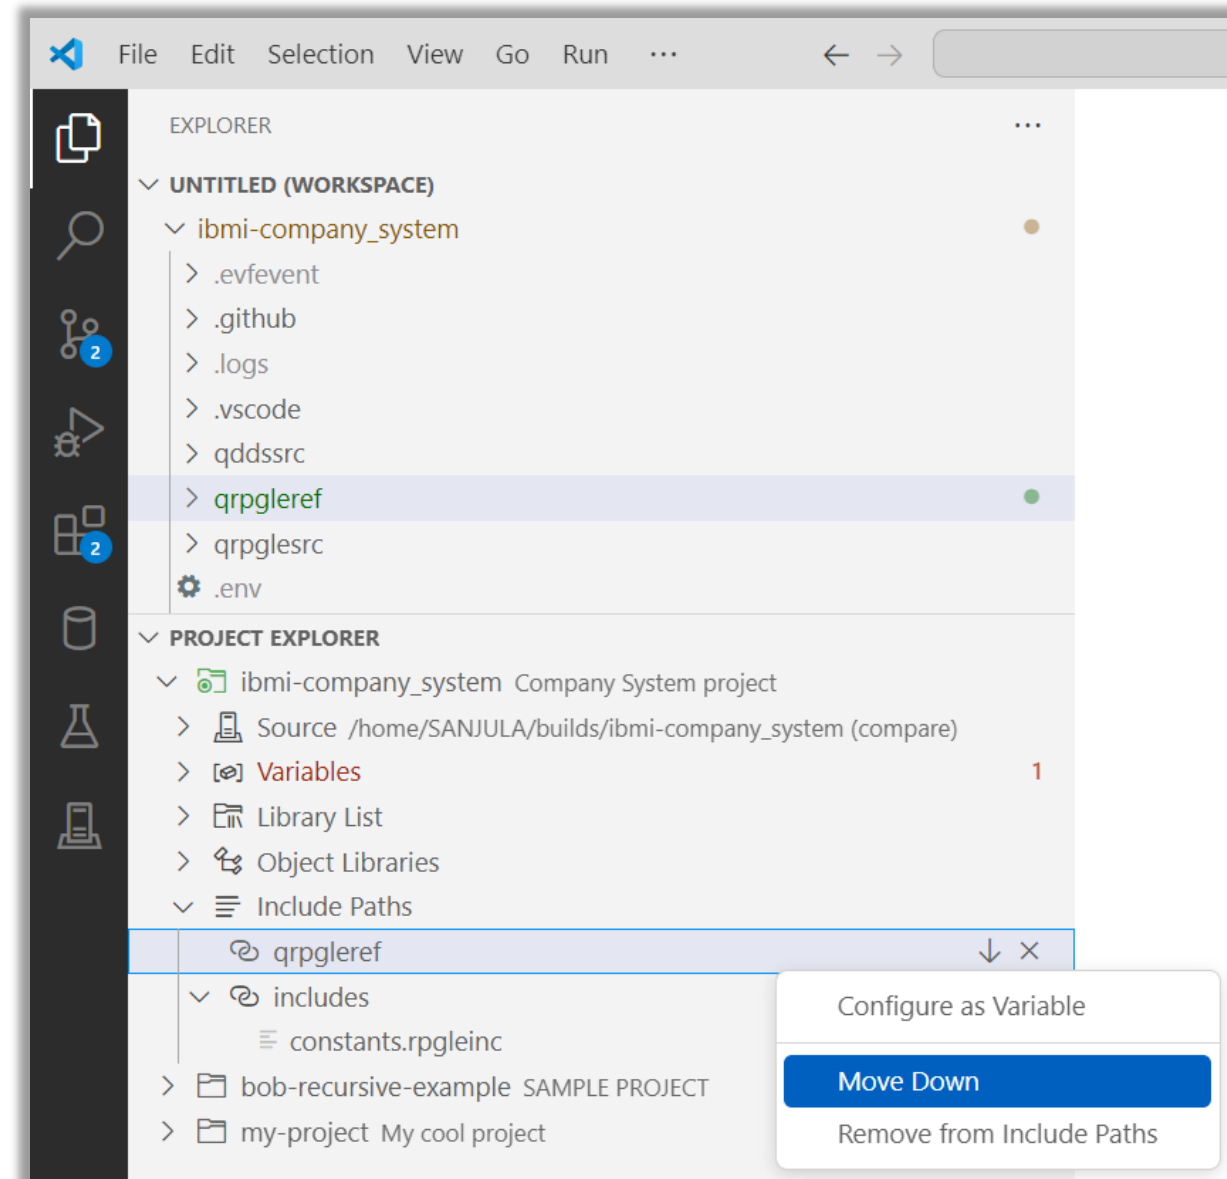

Browse Object Libraries

- The place for developers to easily see, debug, and manipulate the results of your build
- Another place to manage libraries in iproj.json (curlib, objlib, preUsrLibl, postUsrLibl)
- Manage libraries, objects, and members

Manage Include Paths

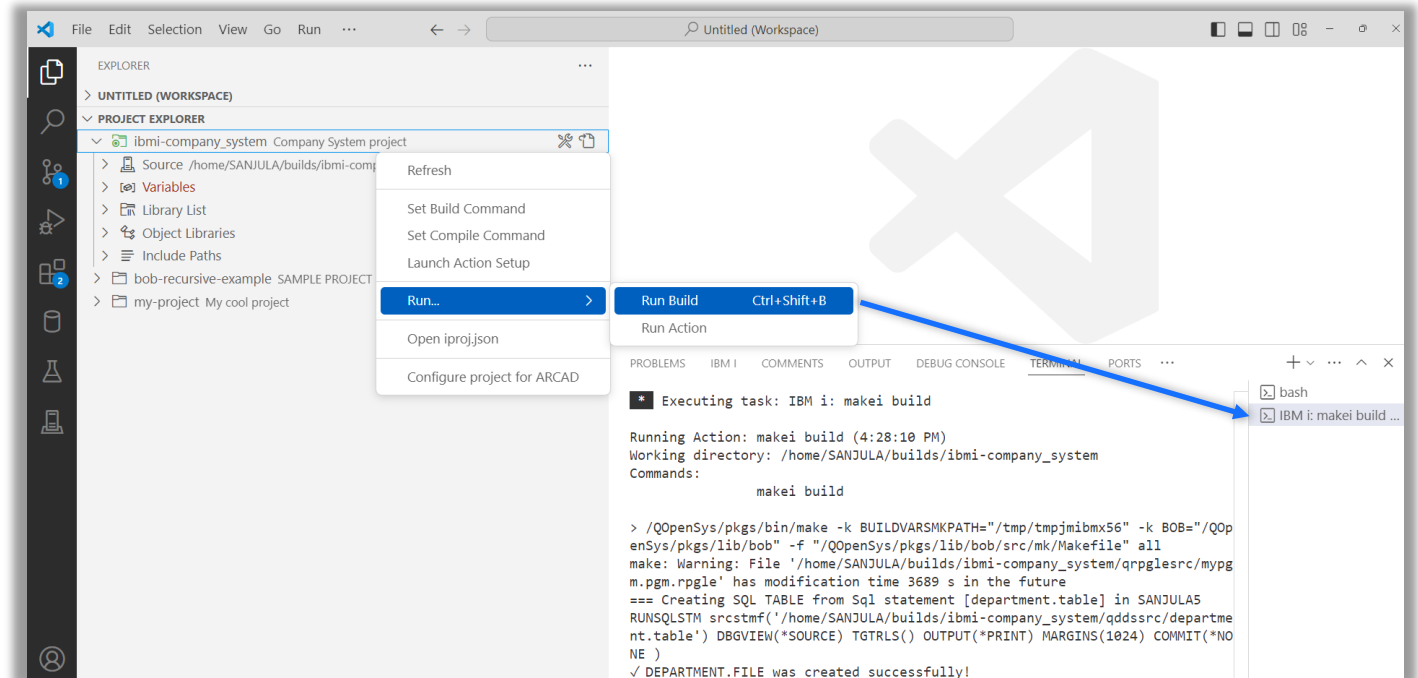

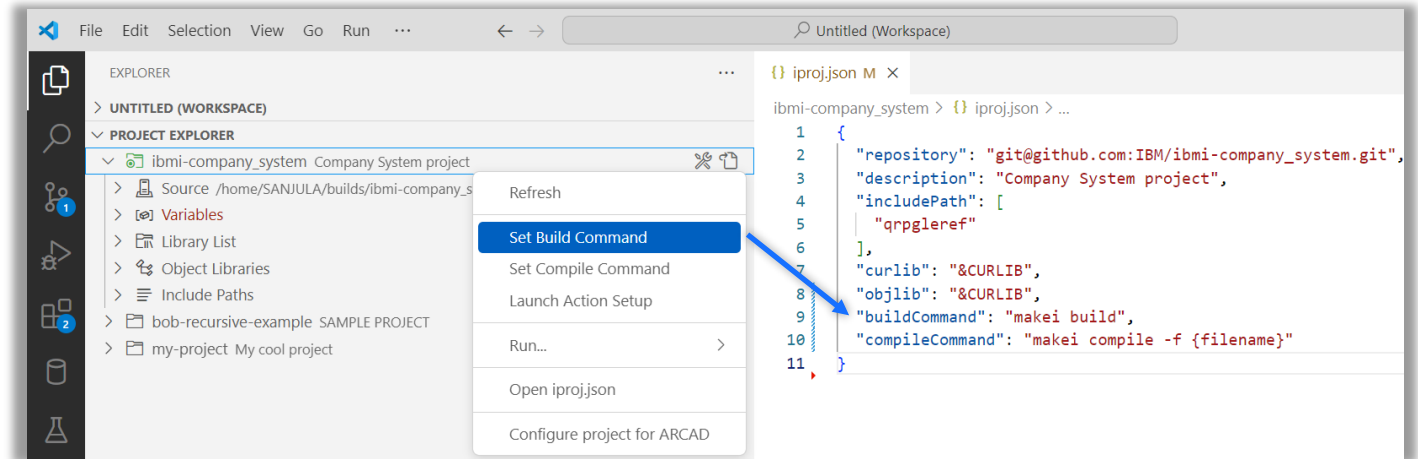

- Self-contained projects should know where to find includes within the project
- Add, remove, and reorder include paths
- Visualize if includes resolve locally or to remote IFS

Build and Compile

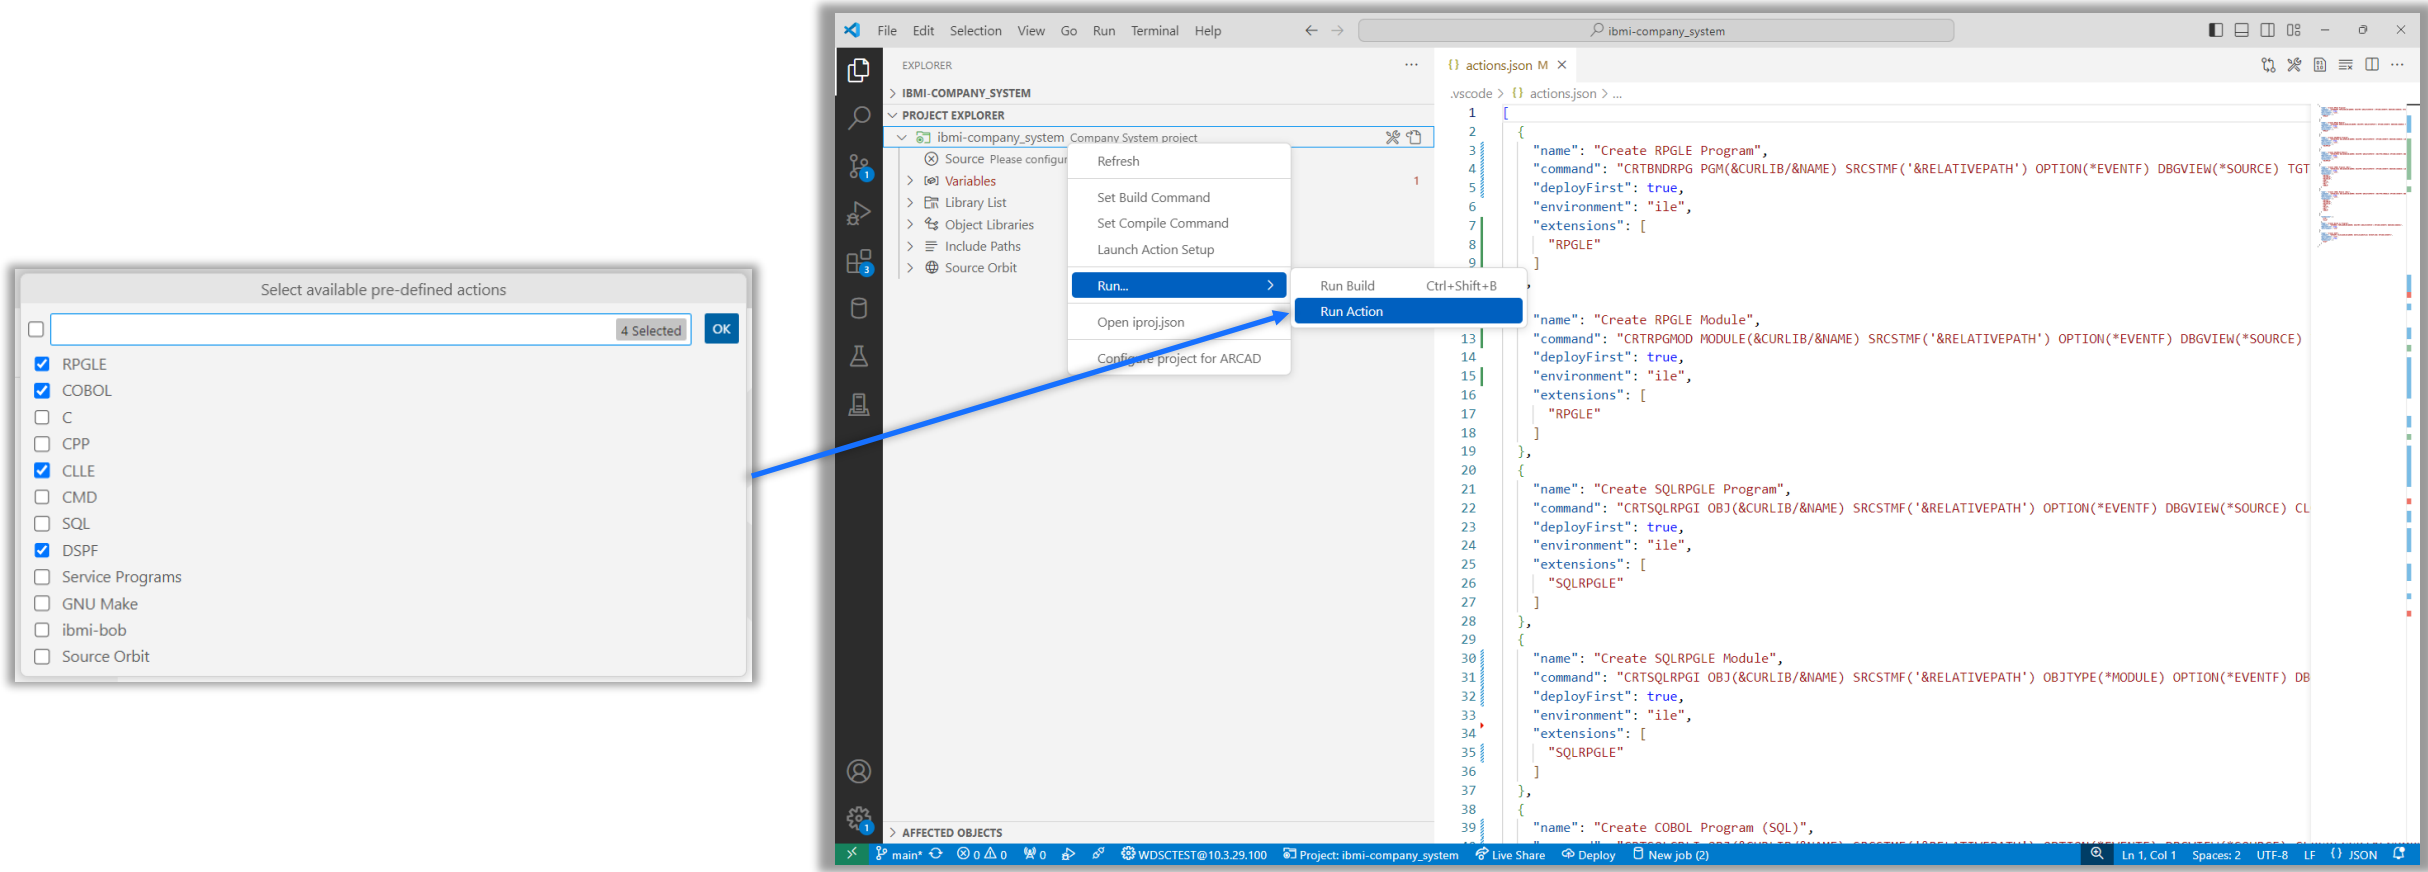

- 1 Deploy
- 2 Run build or compile command
(any build framework)
- 3 Download logs and evfevent files

- Building
 - Set build command
 - Run Build (*Ctrl+Shift+b* or *Cmd+Shift+b*)
- Compiling
 - Set compile command
 - Run compile (*Ctrl+Shift+c* or *Cmd+Shift+c*)
 - On active editor
 - On file or directory in File Explorer
 - On file or directory in Source

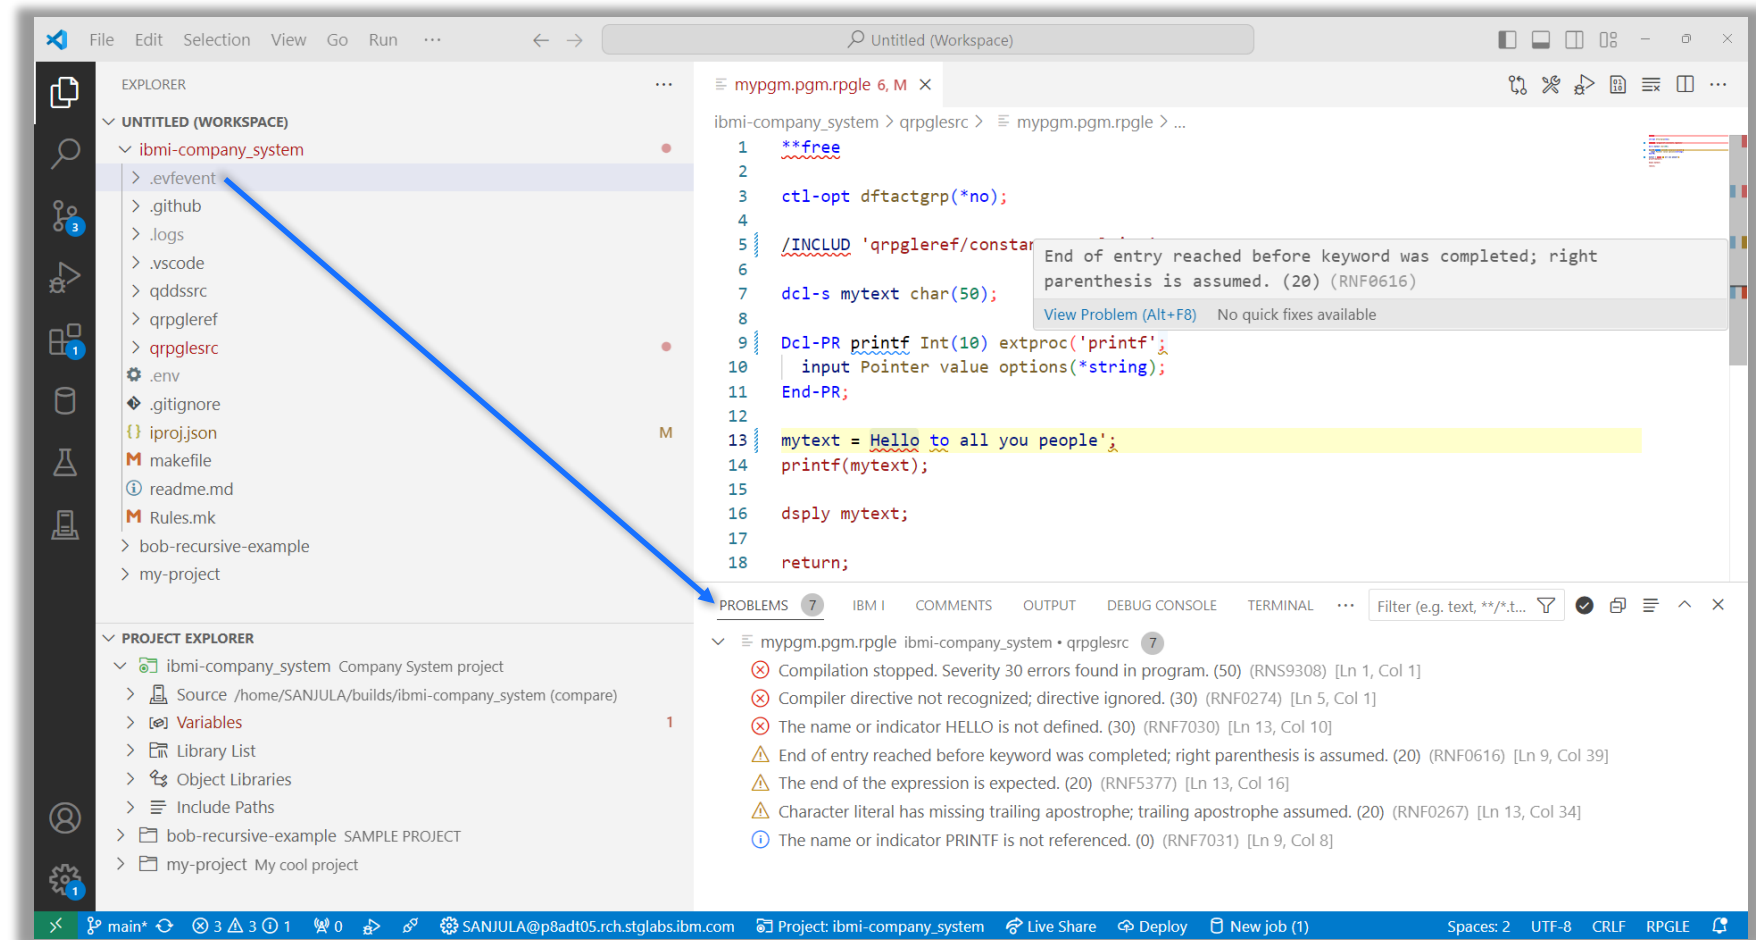

Run Actions

IBM i Project Explorer also supports running Code for IBM i's custom workspace actions

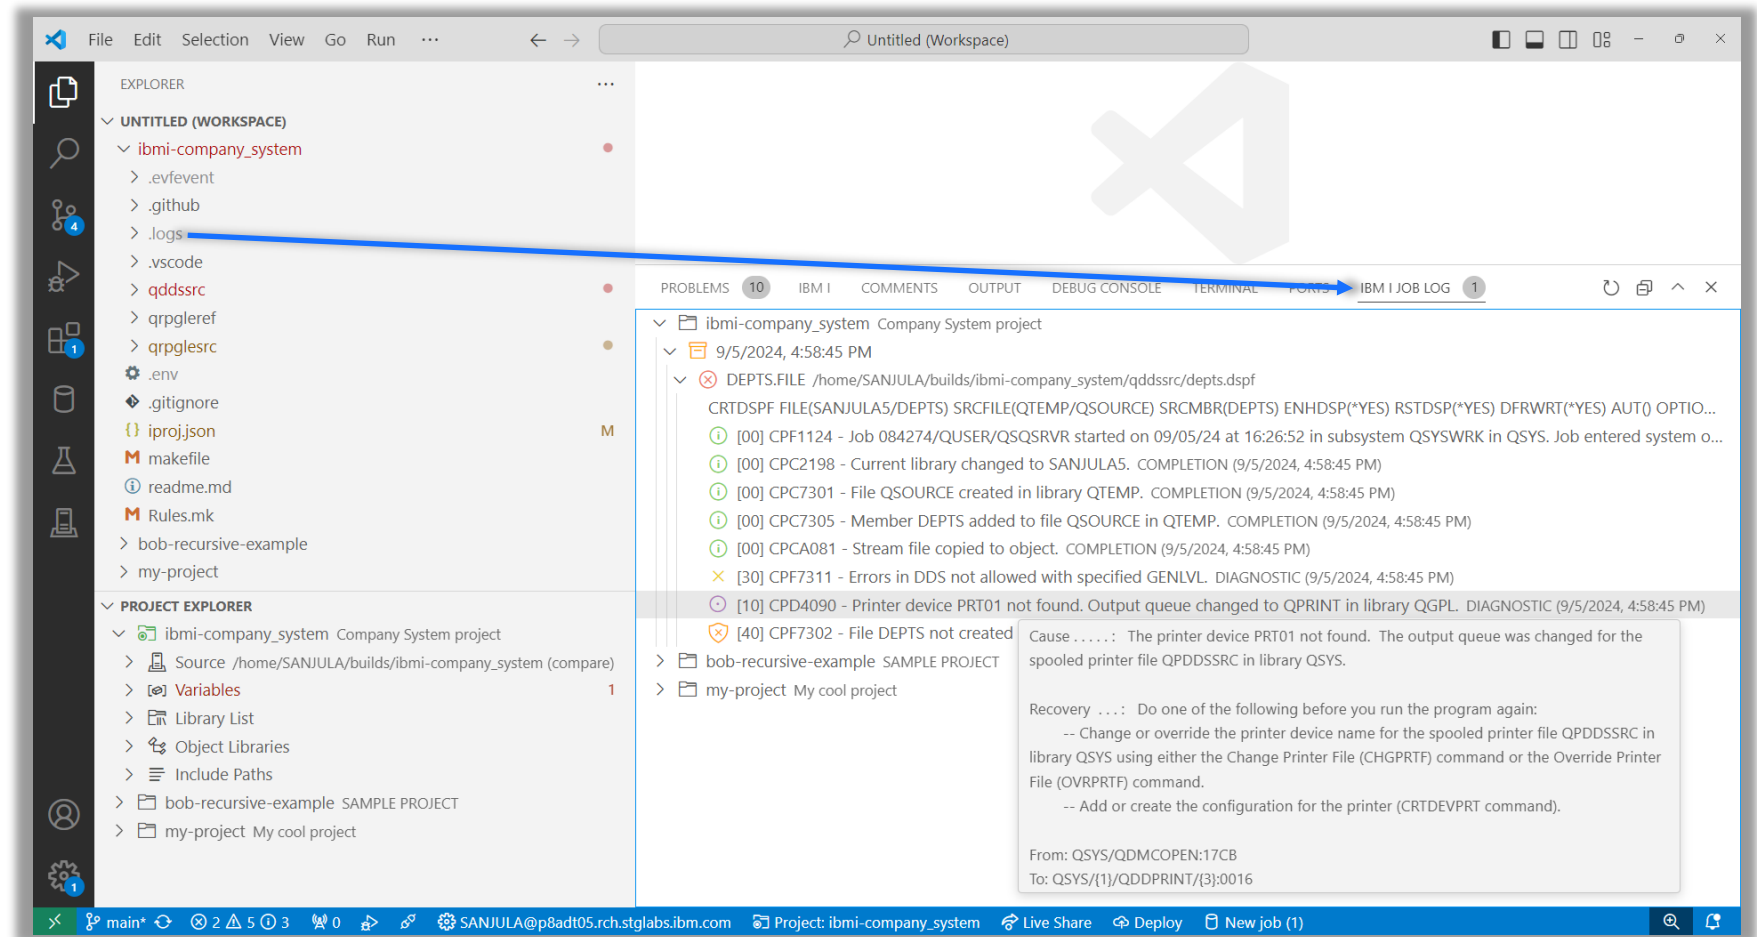

View Diagnostics

- Visualize build or compile diagnostics in the Problems view
- Evfevent file diagnostics are dumped in a .evfevent directory after a build or compile
- Diagnostics are also rendered inline in the source file

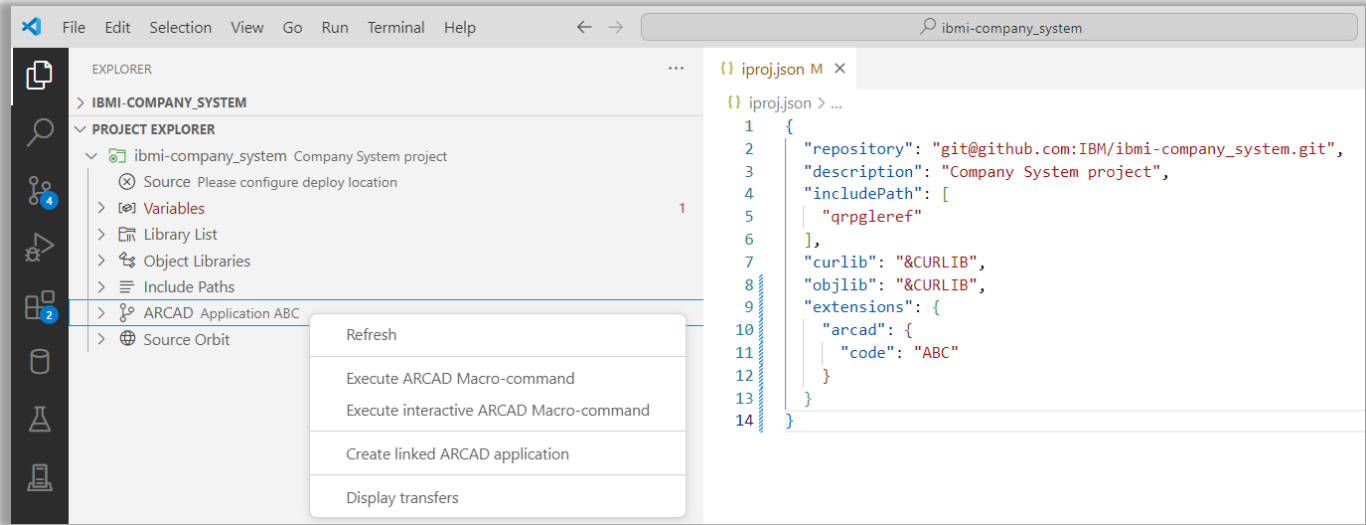

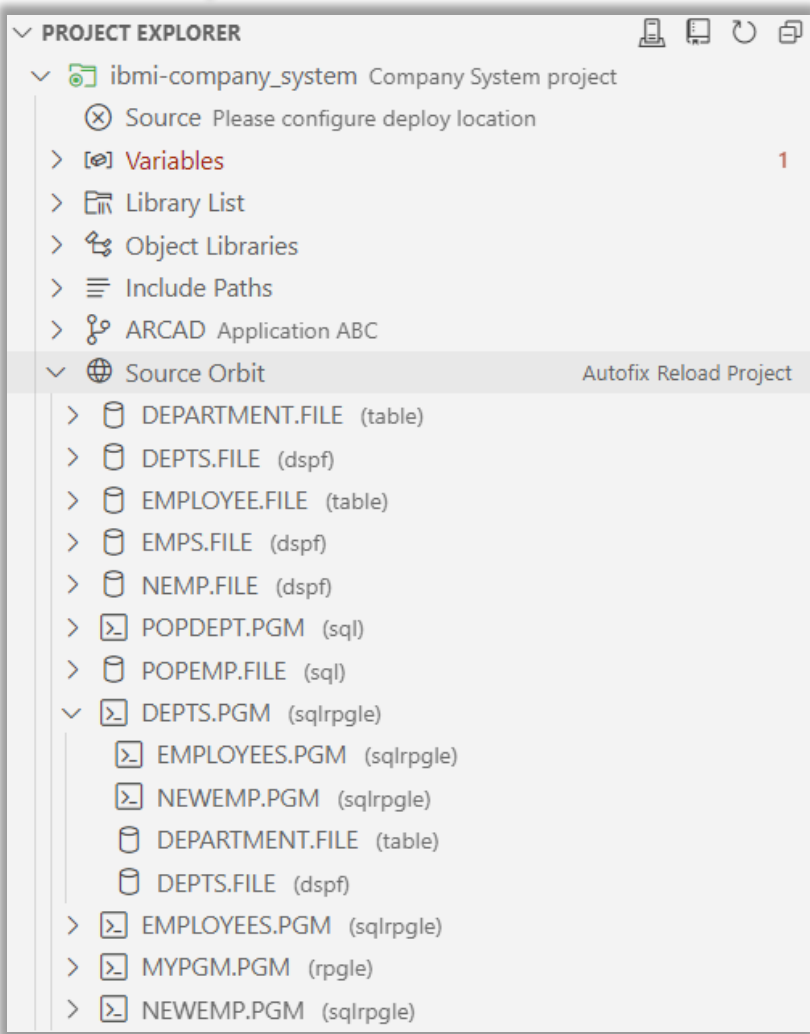

View Job Logs

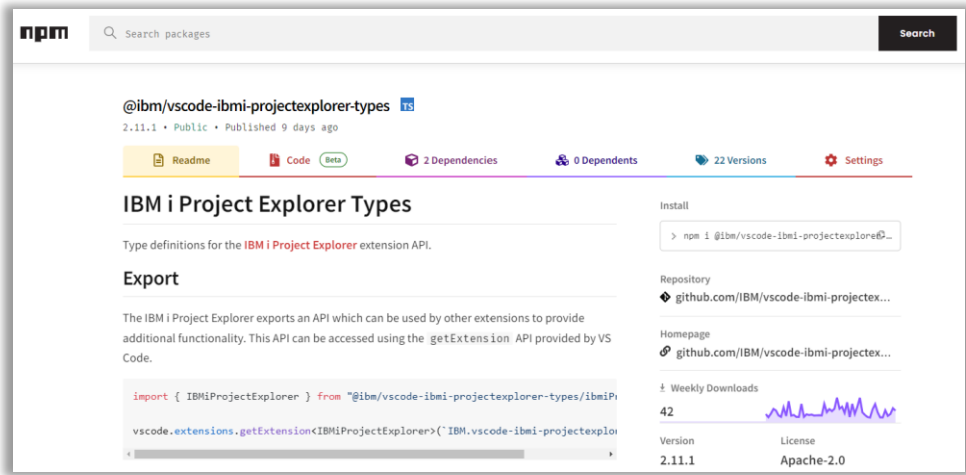

- Visualize and manage anything that could be seen in an IBM i job log including second level help
- Job log and spool files are dumped in .logs directory after a build or compile
- Track up to 10 of the previous logs in memory
- Organized by the ILE objects being built
- Filter by failed objects or severity

Integration

What can you
integrate with
IBM i Project
Explorer's API?

Demo
